With two styles of shingles and two styles of roll roofing to choose from you'll find Everlastic just the thing for every roofing job. Three of the four styles are surfaced with crushed slate in permanent rich color-tones of red or green. No roofings *at any price* are handsomer.

Everlastic Roofs will prove good advertisements for you and good investments for your customers.

Barrett Everlastic Roofings are carried by enterprising dealers everywhere. If your dealer does not carry them, write us and we will tell you where you can be supplied.

Everlastic Multi-Shingles.

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Tylike Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Tylike Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

WHEELBARROWS AND DRAG SCRAPERS

Results and Tangible Dollars and Cents Saving Combined

It accomplishes both, therefore, you can specify it with this assurance. *Experience proves both.* Everywhere it is used—on all inside surfaces—it gives a first-class, hard finish that stands the test of time. It is economical not only to *use*, but in actual *low cost*, as compared with other paints. *It goes twice as far.* Is does not peel nor rub off. White and colors.
By the bbl., 10c lb. (40c gallon); smaller lots, 12c lb. (48c gallon). Special price to contractors. *Liberal testing sample free to prospective big users.*

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

tractors serving them has upset the market and sent prices for some materials to the highest levels on record. There was an effort to cover not only for legitimate building which owners actually had funds to build, but for an immense amount of work not yet designed and without hope of financing.

The volume of orders resulting was wholly beyond the ability of material manufacturers in some lines, notably cement, to cover, and as always happens in times of shortage, whether actual or mental, some producers took advantage of the situation. The law of supply and demand operated to bring about exactly what the saner heads hoped would not happen.

I do not know that we can complain of the operations of the law of supply and demand, and yet there are times when that law can and should be hindered in its operation. I know of no better example than the action of the U. S. Steel Corporation in holding its prices level regardless of the action of other concerns selling in the same markets. The price of cement today from the Steel Corporation subsidiary is 15c to 30c under the price charged by most of the cement companies and the reason is simply that the Steel Corporation is big enough and far-seeing enough to realize that for the good of the country we must not continue to advance prices, but rather to seek means of reducing price levels, and that no mental state or theoretical demand should be permitted to upset the program which it is wise for the country to follow.

Today's situation is not one of actual shortage, at least in cement. For instance, the Illinois State Highway Commission made contracts for cement early in 1919 which, added to cement already contracted for but not used, amounted roughly to 2,000,000 barrels. The full program of road construction was not carried out, leaving 1,200,000 barrels on order against 1920 needs. Then the Commission, after due study of the situation, planned a further ambitious program and purchased rather against the will of the cement companeis, an additional 1,800,000 barrels, making a total of 3,000,000 barrels under contract for 1920 use. Manifestly that program is impossible of fulfillment.

What then of the 3,000,000 barrels contracted for by one single state, more than 3% of the cement industry's greatest annual production in the past. Unquestionably the larger part of it will be released during the year and be available for other work. But what of the effect upon the cost of cement required for other construction that should and will go ahead this year? Evidently an opportunity for the law of supply and "theoretical" demand to work. The cement companies could not sell that cement twice, no matter how reasonably sure they were of its going over for another year.

Their only course was to add its total to their obligations and when the total equalled their probable ability to ship, considering productive capacity in the light of probable supplies of labor, raw materials, fuel and transportation, to refuse to write further business. Cement stocks are said to be less than half what they should be at this season. Yet cement will probably not be the limiting factor in construction this year. Transportation service and shortage of other materials and labor, together with the high prevailing prices, will probably set a limit short of what cement stocks would permit. There may be localized cement shortages but not a general shortage. Yet the effect upon cement prices and the impossibility of covering for cement remain.

Were the State of Illinois alone in seeking more cement than it could possibly use, the situation would not be serious, but a multiude of owners have made ambitious building plans, some actuated by the desire to put away profits into plant and others by a desire to protect themselves should they perchance desire to build this year. The total of orders so resulting has caused the present situation, a theoretical shortage, whereby a legitimate project initiated today cannot be covered as to cement requirements at any price.

We cannot blame the producers, individual owners or ourselves for having been party to this orgy of covering. Each has considered his own best interests, but with a disastrous result to the

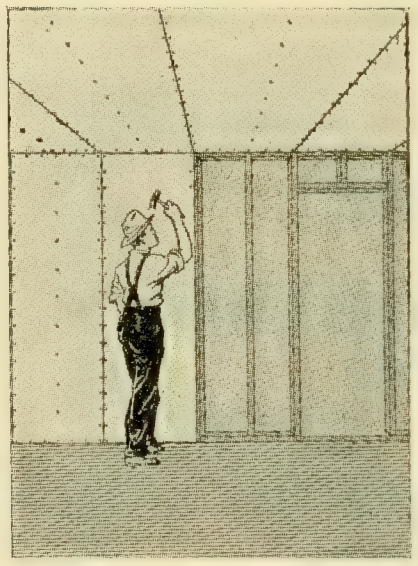
SHEETROCK
WALL BOARD

THE DIGNITY and beauty which you would associate with the rooms of your home, the permanence and fire-resistiveness valued by every builder, are achieved easily and economically with Sheetrock.



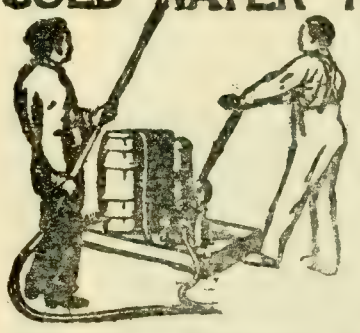
All enduring structures have been built of rock—and Sheetrock is a wall and ceiling material of pure gypsum rock.

Because its every unit is a broad, firm, ceiling-high sheet of rock, Sheetrock cannot warp or bulge. It cannot shrink or pull away from the nails. It does not buckle or crack, but remains flat, smooth and inviting as long as your building stands.

Rigid and retentive of shape, walls and ceilings of Sheetrock take any decorative treatment perfectly. You can paper Sheetrock. You can tint it, or paint it—for Sheetrock is alum-sized—or you can panel it. Where you want an uninterrupted surface, free from paneling, you can have it, with Sheetrock. You can use Sheetrock just as it comes from the factory, in its attractive finish of soft, mist gray.

Besides its durable and decorative qualities, Sheetrock excels in many other properties. It is clean, dry and sound-proof. It insulates against heat and cold. It is highly resistive to fire. Because of its rock nature, Sheetrock cannot burn.

Factory-cast and factory-finished as to workmanship, Sheetrock is constant in quality, uniformly gauged in thickness, uniformly even in surface.



Anyone can apply Sheetrock quickly. The U. S. G. processed gypsum is sheathed in a heavy protective coating, so that while solid and stable, Sheetrock is sufficiently flexible to be easily and inexpensively applied. Sheetrock can be cut, sawed and nailed. The U. S. G. Patented Reinforcement at the joining edges lends extra nailing strength and insures a perfect union.

operations of all. The Lump-Sun contract has been made almost impossible and owners hesitate to enter into cost-plus contracts without definite knowledge as to what will be the cost of basic materials.

If we could squeeze out the projects certain to go over to 1291, we could accomplish much for owners' pocketbooks and could stabilize the general construction situation greatly.

Some theoretists with considerable knowledge of the trend of industry and finance, see in the foreign exchange situation a possible arresting of production due to the impossibility of competing in foreign markets and to being flooded with imports at prices disastrous to American manufacturers who have to pay inflated dollars for raw material and labor and cannot manufacture at Europe's costs.

We see higher interest rates applied to building loans. The manufacturer who cannot finance his own new plant pays now 6% on land and 10% on building, against rates of 5% and 8% prevailing before.

As a result of these and many other factors we may see the wholesale cancellation of contracts for construction operations which can only return dividends under present inflated prices. Should such wholesale cancellations occur, we might find no shortage of the basic materials. Yet outstanding contracts for materials on work going on would still be priced at fictitious values.

Such a change could not come about except at the cost of a considerable wrench to our industrial and financial fabric. Yet the immediate effect would be to release enormous amounts of material and labor for the production of vital necessities. We are short enough of these to take all the existing man power and all the materials it is possible to produce. We have vital building needs—housing is perhaps first and roads second. We need new factory capacity for the manufacture of living necessities. Some classes of building may well wait.

What is the answer?

My belief is that the architect and contractor may advise their client who wants to erect an essential building to permit the builder to cover only for such materials as apparently are normally priced and available; with the expectation that within a short time there will be enough orders cancelled with the material producers to permit getting reasonably prompt deliveries at favorable prices; and that by staying out of the market until such time as the materials are actually needed the entire market will be steadied and freed from factors now holding it at undue levels.

The speculative promoter may well be discouraged from floating a bond issue for 105% of the present cost of a new apartment hotel. The manufacturer of non-essential commodities may well be prodded by his banker into questioning the wisdom of putting present profits into new plant whose cost will be returned only if his commodity continues to be sold at today's high prices. The State Highway Commission may well confine their plans for new construction to the limits of man power and equipment available for that work, rather than upon the mileage needed or the size of the bond issue voted.

When such general cancellation occurs, then perhaps there will be lumber, cement, nails, tile and sash sufficient for vitally needed work which can and should go ahead and prices may drop to a point corresponding to the facts of the situation.

The condition is largely a mental one and if we can be sane enough to see it and act in the only way which can help, all of us together, and not each seeking to safeguard his own little operation, we shall see a substantial betterment and the prospect of doing all legitimate work at a legitimate price.

The nation has serious problems to solve and the present wild orgy of building is only adding one more complication. There was never a greater need for legitimate building, but we shall not get the really essential building done if we attempt to carry on a "paper" program which inflates prices to the point where the home builder and the manufacturer of fairly-priced basic necessities are squeezed out of the market.

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

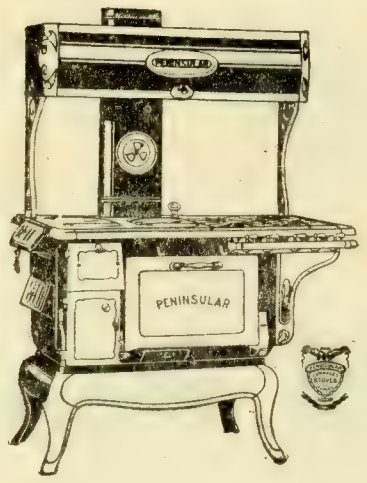
STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.



We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

As The Editor Sees It

IN these days of costly construction standardization in house building is becoming more imperative, as economy in labor and materials can thus be effected. Following standardization, improved methods of construciton have been devised and experiments made by many architects and builders.

Notable among recent developments in construction is the concrete, frame and stucco system devised and designed by Ballinger & Perrot, Philadelphia architects and engineers.

A model house on exhibit at the Master Builders Exchange clearly demonstrates the many advantages of this new form of construction. Architects, engineers and builders should take advantage of the opportunity to inspect this model, which will be exhibited for a limited time and will then be displayed in New York City.

The Ballinger & Perrot Concrete, Frame and Stucco system of construction must not be confused with the ordinary type of stucco on wood or metal lath over standard wood frame, where trouble is experienced with numerous cracks due to shrinkage and settlement.

The stucco for the Ballinger & Perrot system is made up of Portland Cement mortar and treated with water-proof materials. This water-proof treatment prevents rusting of the reinforcing metal as well as stops the passage of moisture through the 1½ in. slab. There are no cracks and no tendency to shrink or settle; the 1½ in. outer coating being backed up and supported by reinforced concrete studs and beams. The 1½ in. slab is cast with the studs and beams as a monolith, making it an extremely rigid structure, which is not only self-supporting, but carries the roof and floor loads as well, the wood and frame work only temporarily carrying the load until the concrete sets up.

After the cellar has been excavated and the stone or concrete foundation wall is built, the first floor wood joists are then set in place on the foundation walls and on this a frame, consisting of studs, hoists and rafters, is erected in the usual manner of building the skeleton of a frame house. Every fourth stud is doubled, allowing a 3 x 4 in. space between which, when filled with concrete, will form a concrete stud. At the second floor and roof levels a ledger board, with bottom attached, is placed over the studs and so arranged that when filled with concrete they form beams, which in connection with the vertical concrete studs, makes a complete homogenous concrete frame. The concrete studs when filled are continuous from foundation to roof and the main beams form continuous bands entirely around the building. In this manner the wood frame work of the building is erected. The roof is completed as well as the door and window frames before placing of the concrete. If necessary, either because of delay or for economy of construction, this wood frame work can stand for some time, as it is amply self-supporting.

The next operation is the nailing of heavy water-proof paper, on the outside of the exterior wall studs, leaving the spaces between the double studs to receive the concrete. Over the water-proof paper expanded metal or other form of reinforcement is stretched. The concrete studs and beams are reinforced with steel rods. The ledger boards have a bottom wood piece or form so that when filled with concrete they act as beams to carry the floor joists and roof rafters.

The concrete work can now be started. The 1½ in. thick concrete coating can be applied to the exterior, either by hand, cement gun or stucco machine. If applied by hand, the concrete, studs, beams and ledger boards are generally poured in advance, and a reinforcement of rather fine mesh is used. This reinforcement covers the openings left in the water-proof paper, and thus becomes the front form for the studs and beams. The concrete when poured flows only partially through the fine mesh, leaving a rough face, which later forms a good bond with a 1½ in. outer coating. When the exterior coating is applied by a cement gun or stucco machine, the reinforcing is of a larger mesh and the concrete studs and beams are filled at the same time that the outer coating is applied, the concrete

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

material passing readily through the large mesh of the reinforcement.

Any desired color effects can be obtained by adding mortar stain to the concrete while it is being mixed. Also, in place of the 1½ in. concrete slab, a 4 in. brick wall can be substituted, the brick being anchored securely to the concrete studs. Variety can be obtained by having a brick first floor and a stucco second floor or by having stucco throughout with brick trim or various other combinations.

After the exterior wall is completed, metal lath is applied to the inside of the wooden studs and the interior of the building is plastered. This completely encloses the wooden studs and gives the very desirable dead air space. The wood studs act in the dual capacity of temporarily supporting the stucco and concrete frames, while ti is being placed, and later as furring strips in the finished building.

There has been no attempt made to make the entire house fire-proof, as for commercial and financial reasons it is deemed sufficient if the exterior and party walls are of fire-resisting structure, it being an established fact that in group houses with party walls made of fire-resisting materials, there is little danger of fire spreading to other houses, each house in itself being an independent unit when the spread of fire is considered. However, these are merely questions of economy, and if desired the floors can be of thin concrete slabs supported on concrete beams. As to the design of the framework, the system is extremely flexible and especially designed beams can be placed over long window openings and similar places if desired.

The B. & P. Concrete, Frame and Stucco System procures all the virtues and advantages of masonry construction, yet retains practically all the economy of wood construction. It produces a reinforced concrete masonry house, which ordinary members of the building trade may erect without especial training.

The B. & P. System can be built quickly and cheaply and a fair degree of economy can be maintained, even in the building of a few houses. The ordinary type of concrete house requires expensive standardized forms to cover the high initial cost of which, many houses of one unvarying appearance have to be built. The elastic B. &. P. system entirely avoids this monotonous sameness.

The B. & P. System has fire-resisting qualities, and all the other advantages of a typical concrete house, besides having many added features of its own. For example, the benefits which come from dead air space in the walls may be mentioned. The interior of the house is entirely free from condensation and dampness; the house is cool in summer and easy to heat in winter.

While the wooden frame house is very slightly cheaper in first cost, yet its maintenance is so high in comparison with that of the B. & P. house, that it actually costs more.

In comparing the wall of this construction with a solid monolithic wall 6 in. thick, the actual material in the concrete frame and stucco wall is just one-third what it would be in the 6 in. wall. The saving of cement, sand, etc., in the walls is sufficient to construct a reinforced concrete fireproof floor in the first floor of a house. This one fact alone is of great importance, as it permits making a basement of the house fireproof, while at the same time saving lumber which would go into the first floor construction. As the modern tendency of conservation of all our raw materials is very important, this method of construction will help to solve some of our building difficulties.

* * *

ACTIVITIES OF THE BUILDERS EXCHANGE, PHILADELPHIA

Standardization of house construction and co-operation among the builders was again emphasized by Mr. Thomas Holden at the Exchange luncheon, last Thursday. Mr. Holden's statistics were interesting and surprising and from his deductions we cannot look for any great decrease in the cost of building in the near future.

Thursday, April 22, Reverend Thomas Sparks Cline, a recruit of the Builders Exchange, who served in the 19th Engineers, U. S. A., will address the members at the weekly luncheon. The Reverent Cline has had many thrilling experiences and his address will be most entertaining.

Thomas Armstrong, Chairman of the Entertaining Committee of the Exchange, assures the members that the Annual Shad Dinner, which will be held May 13, will surpass all previous outings and has suggested a holiday be taken that day and urges everyone to make preparations for an unusually good time.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

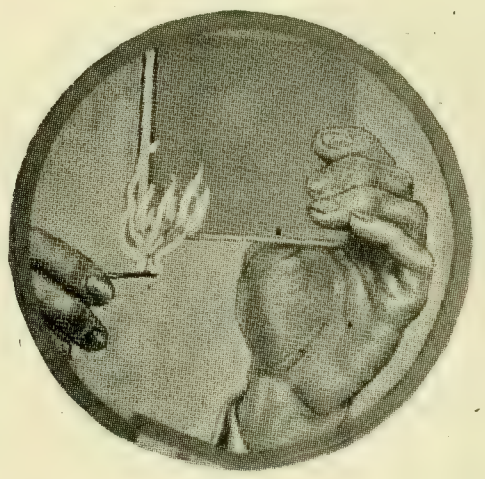
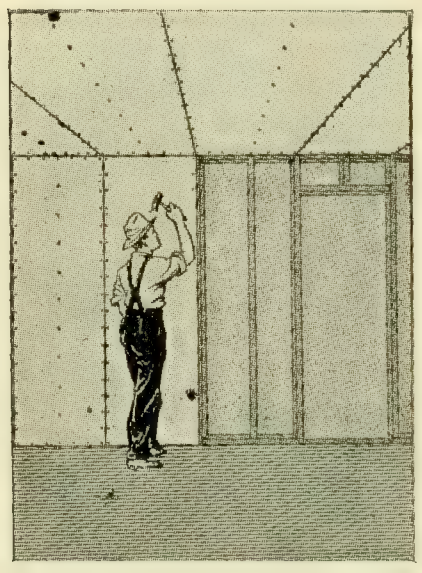
ELECTRIC ELEVATORS OF HIGHEST EFFICIENCY FOR EVERY SERVICE.



LET US SHOW YOU.

Both Phones



SHEETROCK
WALL BOARD

SHEETROCK is not only cheaper than lath and plaster, but saves time and labor. It's made of pure gypsum rock, can be papered or painted as well as plaster, is stronger than wood, and won't burn, warp or shrink.

This scientific, fireproof wall board fills any plastering need. Instead of having to nail on lath and then troweling, and waiting for your scratch coat to dry, and your finishing coats to dry, you can nail Sheetrock to walls or ceilings and they are ready for paint, paper or panels.

Ask for a sample and you'll see for yourself why the Government has used over 5,000,000 feet of Sheetrock.

Greatly Outlives Wood Wall Boards and Costs About the Same

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

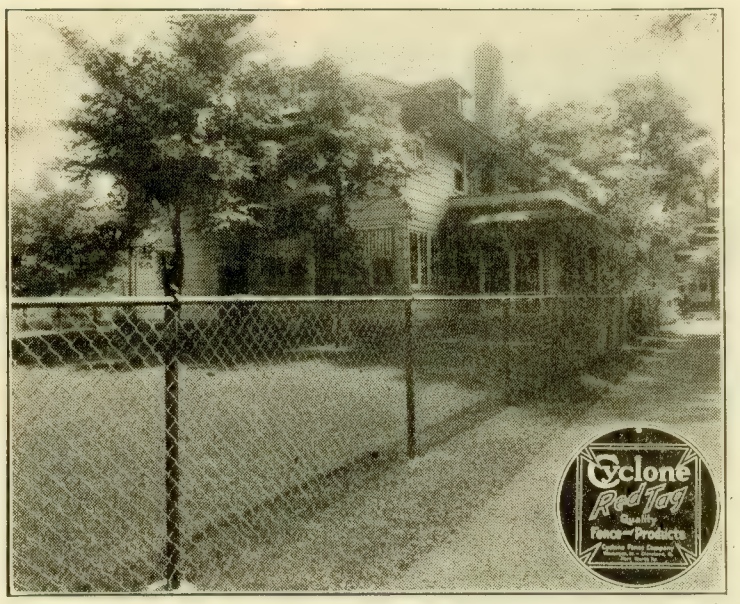
In Time of Fire

How important to you is the difference between guessing and certainty?

You can be certain that the NU-EX will always work.

IN the fact that fire apparatus is infrequently used lies a very grave danger. Most owners forget or neglect to inspect and test extinguishers as often as they should. Machines must be taken apart, examined carefully, tested for efficiency. Neither a pleasant job or a clean one.

More than that. You can never know whether an ordinary extinguisher will work or not when needed, until the emergency arises and you try. Then it is too late.



How much is a definite certainty of safety worth to you? The lack of it can cost a very great deal in both anguish and money. The value certainly on such a point cannot be measured in mere dollars.

When you have a NU-EX you can be absolutely sure of real fire protection--always. You cannot forget the NU-EX. Every time you glance at it you can see, instantly, that it is ready to serve you well.

Nothing about it to take apart. No pumping to do. Nothing can go wrong. Automatic and instantaneous in action. Full particulars for the asking.

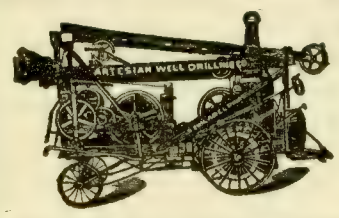
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

As The Editor Sees It

The GUIDE published on March 17 an article on the proposed Delaware River Bridge from Philadelphia to Camden with a plan map showing the Philadelphia approaches and transit connections.

On another page of this appears a plan map and article describing the details connected with the Camden end of the Bridge.

Our former article received so many favorable comments that we deem it appropriate to present the Camden features.

Architects, engineers, and business men commended on the efficiency, economy, and broad vision of local and interstate requirements included in our comprehensive plan.

* * *

BILLS TO RELIEVE CONTRACTORS

A measure has been introduced in the house by Representative Britten, of Illinois, to make it possible for the secretary of the navy to investigate and reimburse contractors who have suffered losses since April 6, 1917, in their dealings with the government. Bills looking to the relief of government contractors in the War Department have also been presented.

Only those contractors who can file affidavits to show that they did not make more than six per cent. net profit on the entire volume of business done for the government will be allowed to enter claims for reimbursement. The period of time included in this profit-making stipulation is from April 6, 1917, to June 30, 1919. Sub-contractors and material men are to be included in the term "contractors." The claims are to be filed within sixty days of the passage of the act, which is H. R. 13390.

The bill for the relief of contractors in War Department was presented to the senate by Senator Stanley and is S. 4156. It would empower the secretary of war to ascertain whether any of the contracts let for work on river and harbor improvements, but not completed prior to April 6, 1917, have become inequitable and unjust on account of increased cost of materials. The secretary is also authorized to report to congress a statement of the amounts he has found should be paid to such contractors if losses have been sustained because of the changes brought by the war, provided the statements do not contain anything save the actual losses of the holders of such contracts.

In the event that such contracts were cancelled because of the rise in prices on material and labor, the secretary would be authorized to relieve any such contractor or his bondsmen from further obligation or liability because of the nonperformance of such work or on account of the government being obliged to re-let the contract.

ACTIVITIES OF BUILDERS' EXCHANGE
Philadelphia, Pa.

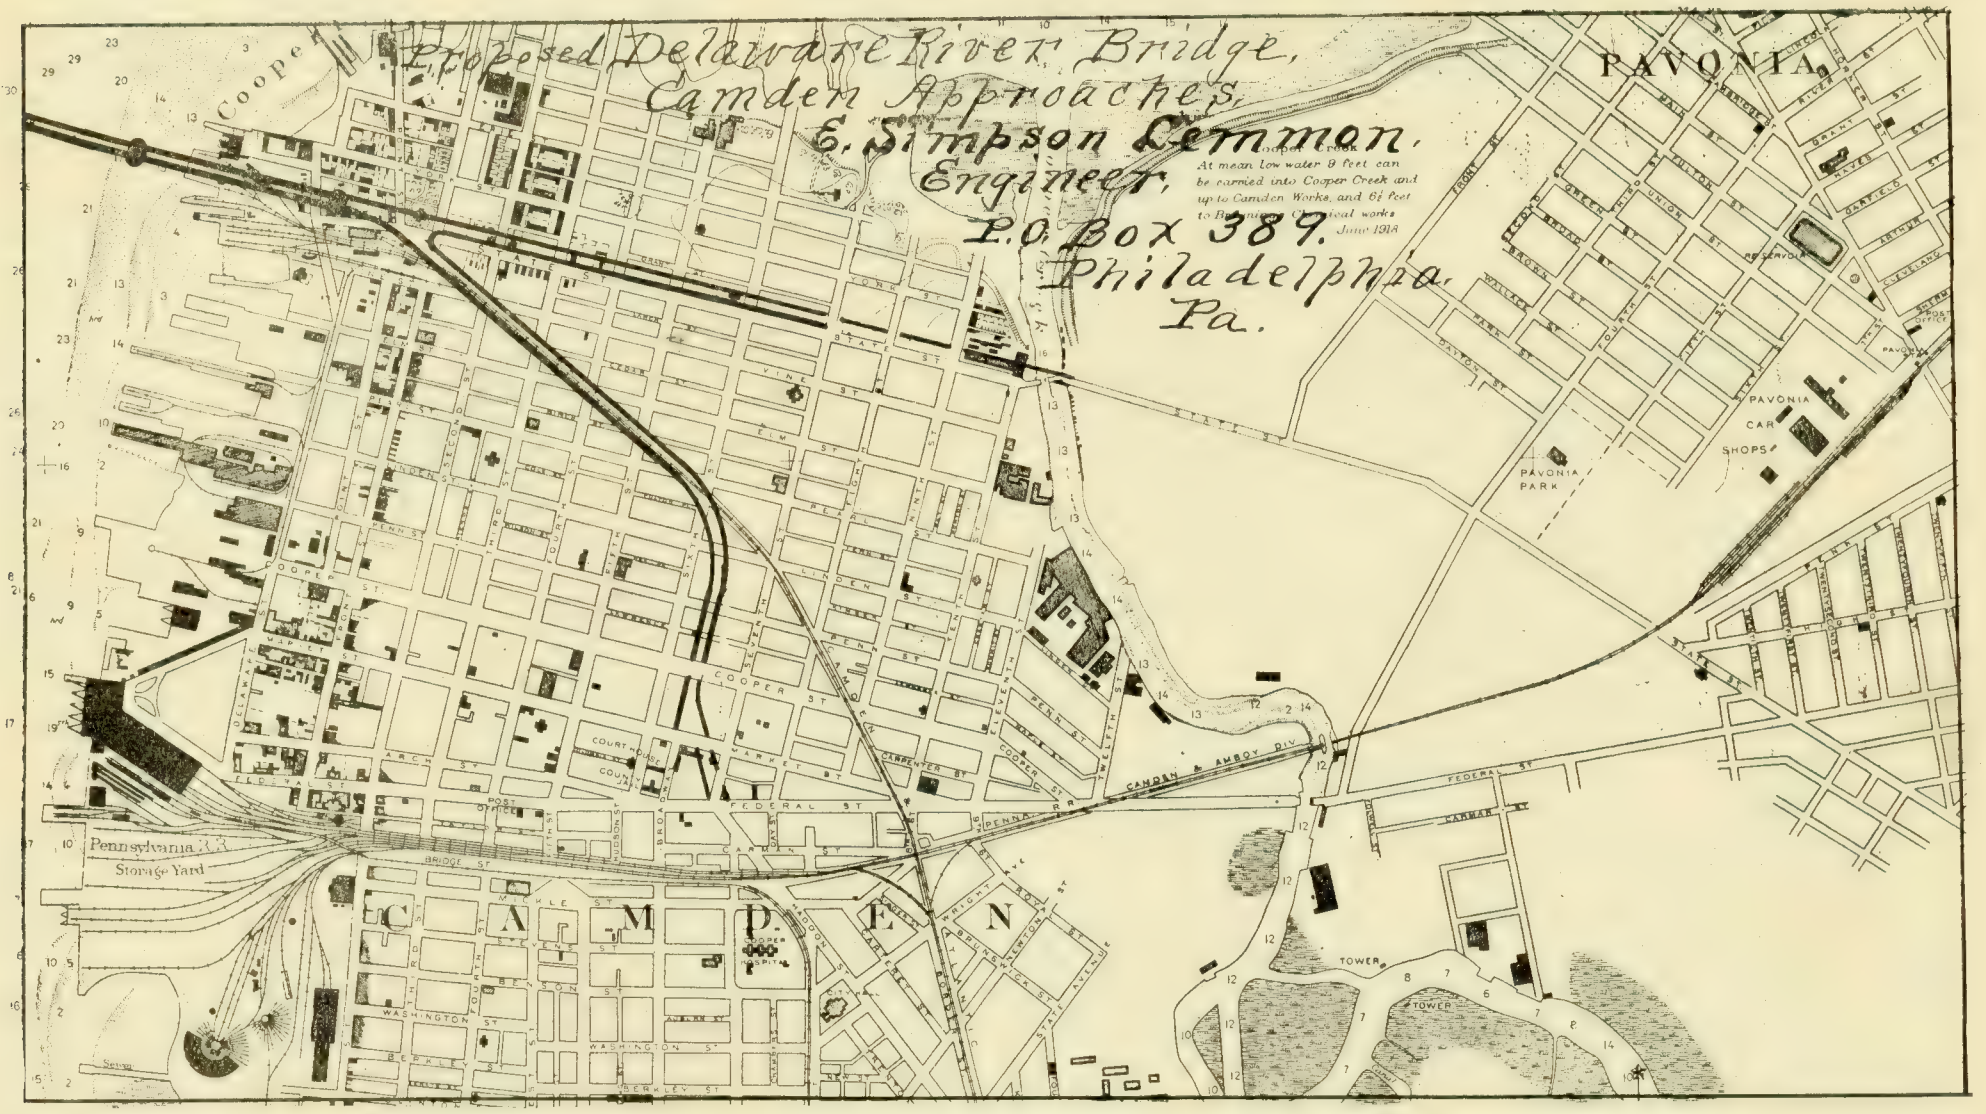
The following letter covers the report of the Quarterly Corporation Meeting:

"The Quarterly Corporation Meeting of the Master Builders' Exchange, held at the Exchange on Tuesday evening, April 20th, was evidence of the fact that new life has come to the Exchange, and augurs well for future progress.

"The meeting was largely attended, and was followed by a rousing smoker and vaudeville show. Proof of the success of the affair is found in the fact that many applications for membership have resulted from individuals connected with the building industries, who desire to be with us, not only for the good times resulting, but also for the good that comes of cooperation and the powerful influence of the Master Builders' Exchange as a whole.

"Inasmuch as the membership of any organization determines its strength in the business world, it is evident that large membership means increased strength.

"That's your cue—GET YOUR MEMBER!



"E. E. HOLLENBACK, *"President."*

The speaker at the luncheon at the Bellevue-Stratford, Thursday, April 29, at 12.30, will be the United States District Attorney William D. McAvoy. Don't forget the date of the annual shad dinner, May 13th, at Mineral Springs Hotel.

THE CAMDEN APPROACHES OF THE PROPOSED DELAWARE RIVER BRIDGE, PHILADELPHIA TO CAMDEN.

By E. Simpson Lemmon, Engineer.

As indicated in a previous article this proposed location of the Delaware River Bridge is intended to take care of all classes of traffic so that all unnecessary delays and inconveniences will be eliminated .

The straightaway interstate or through traffic passes outside the present congested centers. Purely local traffic conveniently and directly reaches its desired destination via the numerous radiating approaches.

On both sides of the river very little valuable property is disturbed or destroyed.

As will be seen by a study of the plan, the eastern end is on a line with State Street near the Bridge over Cooper's Creek, and this connects with main highways running to Burlington, Bordentown and North Jersey and to Merchantville, Moorestown, Mt. Holly and Sea Coast Territory.

The southern end reaches grade at Cooper Street and the roadway continues near Sixth Street to Market Street at Court House Plaza, traffic passing on east side of the Court House to Broadway, Gloucester, Woodbury and South Jersey, passing through next street east of Court House to Haddon Avenue for Haddonfield, White Horse Pike and Southeast Jersey Districts..

This Bridge location offers opportunity for railway traffic connecting with existing railways, providing for continuous railway transportation from the North, West and South through Philadelphia and Camden to New Jersey and the Seashore.

Very desirable features easily included in this bridge plan would be union railway stations of all railway lines located near Spring Garden Street in Philadelphia and near City Hall in Camden.

These locations and connections with other important details have been carefully worked out form a practiced standpoint on other plans not yet made public.

Suburban New Jersey trolley lines crossing the bridge should continue several squares beyond the Philadelphia ends of the Bridge and Philadelphia Trolley, Elevated and Subway lines should also continue some distance beyond the Camden end of the Bridge. In fact, have no denite Bridge terminals, but let the Bridge and its traffic blend with both cities without undue concentration at any one location.

Monumental entrances and elaborate plazas add nothing to the practical value of the project; hence, eliminate them. By giving the Commission control of improvements on property adjacent to the approaches, encouragement can be given monumental and ornamental buildings for business uses with entrances from the bridge levels as well as from the street levels and making them much more valuable.

The designing, the financing and the actual construction of such a project naturally divides itself into three distinct units of one great comprehensive plan.

The Bridge proper, including anchorage piers in Philadelphia and Camden and both river piers, constitutes the principal unit. For the same size and capacity its cost and method of construction remain the same for any location except for its length. As the location shown on this plan is at the narrowest part of the river its cost must necessarily be least because of the shorter length.

The next unit in importance is from the Philadelphia anchorage pier westward and this location has been consid-

ered favorably because of its numerous natural advantages—the small amount of improved property disturbed, the low values of such properties as are to be destroyed, and the further fact that this territory is ripe for active business development.

The portion from the Camden anchorage eastward forms the final unit and those familiar with this district will need no persuasion to realize its adaptability to this plan for many reasons, reasons too numerous to fully describe in this short article.

The cost of construction in accordance with this plan can be kept within a remarkably low gure by practical business methods and co-operation.

A plan of nancing that may be offered at a later time to the proper authorities indicates that the expenditures of public money on account of this plan should not exceed twenty-four million dollars.

We again emphasize the keynote of our article on March 17.

"Omit elaborate, ornate and useless designs and concentrate on utility and real service."

Make Camden-Philadelphia the center of intense practical activity.

—CO-OPERATE.—

* * *

THE GUIDE congratulates Mr. John P. B. Sinkler, of Bissel & Sinkler, on his appointment to the office of city architect for Philadelphia. The appointment of Mr. Sinkler is the first to that position, which is provided for in the New Philadelphia City Charter, but until the present time has remained vacant. The position pays a salary of $5,000.

In connection with the appointment of a city architect, the Mayor said the appointment of a Zoning Commission would shortly be announced.

"It has been difficult," Mayor Moore said, "to obtain the right kind of a man for this important place, because of the limitations set by the old Councils, but in Mr. Sinkler we have found a man of standing, backed by the Philadelphia Chapter of the American Institute of Architects, who is willing to make the sacrifice. The appointment of Mr. Sinkler will enable us to go forward with the Zoning Commission appointment, which will be announced in a few days, and to take up other work that is pressing. The range of work assigned to the city architect runs from police stations to monuments and bridges, and it is believed that Mr. Sinkler will bring to bear for the city the benefit of his studies and wide experience."

Mr. Sinkler is forty-fours years old. He was born in Philadelphia September 10, 1875, and is the son of Dr. Wharton Sinkler, and Ella Brock Sinkler. He received his early education in Philadelphia, attending the Protestant Episcopal Academy and the De Lancey School. In 1898 he was graduated from the School of Architecture of the University of of Pennsyl vania with the degree of bachelor of science in architecture, and afterwards traveled and studied in Europe for a year and a half.

Mr. Sinkler began the practice of architecture in 1902. In 1904 he formed a partnership with Elliston Perot Bissell, under the firm name of Bissell and Sinkler. The work of the firm includes the Confederate Memorial Institute, Richmond, Va.; Abington Memorial Hospital and Nurses' Home, Abington; front of Chestnut Street Opera House, Philadelphia; Whitman's store and Hanan's store, Philadelphia; government housing under Emergency Fleet Corporation: "Noreg Village" at Gloucester, N. J.; "Sun Hill," at Chester, and numerous residences.

Mr. Sinkler is a fellow of the American Institute of Architects, and was formerly president of the Philadelphia chapter of that organization.

The duty of the city architect, as prescribed by the charter, is to "prepare, draft and execute, or to supervise the preparation, drafting and execution of all specifications, drawings and plans of public buildings" to be erected in the city and to be paid for by appropriation of Council. Exception, however, is made in cases where because of the magnitude or character of the work to be done special architects are considered necessary by the city architect and the head of the department under the jurisdiction of which the projected work is to be done.

Special architects are to be appointed by the city architect with the approval of the Mayor. The charter also provides that the city architect may appoint such permanent employes as may be authorized by ordinance of Council.

Although the city architect will have supervision over all municipal buildings for which plans have not yet begun, all construction projects for which drawings exist or have been commenced will remain outside his jurisdiction.

These include the new building of the Free Library, for which Horace J. Trumbauer holds the architectural contract; the convention hall, plans of which have been prepared by John T. Windrim, and certain alterations and extensions at the Philadelphia Hospital for Contagious Diseases and the House of Correction, for which Philip H. Johnson has been engaged.

Joseph A. Roletter has been acting as city architect at a salary of $2100 a year.

CHESTER SHORT 700 DWELLINGS

Chester industrial workers made a public appeal to the people of the city possessing money to build 700 dwellings here immediately. The housing situation is acute and serious, with the result that a survey made today showed 700 families without homes.

* * *

An interesting and helpful booklet, "Barrett Everlastic Fiber-Coating," has been issued by the Barrett Manufacturing Company.

Barrett Everlastic Fiber-Coating is a cement in liquid form that *gives new life to old roofs.* It forms a tough, impervious coating over the entire roof, closing cracks and small holes that would otherwise admit moisture, thus making the roof practically one solid piece and, as far as utility goes, almost as good as new. It spreads readily and anyone can apply it.

Everlastic Fiber-Coating is a remarkable Barrett product, backed by the reputation of a company with sixty years' experience in the roofing field.

This booklet should be is the hands of every contractor, builder and roofer. Copies of the booklet will be gladly mailed to anyone applying to any of the Barrett offices.

GETTING DOWN CLAY.

Builders and contractors are finding that a little dynamite saves a lot of time and labor when it comes to getting down clay.

Charges are placed somewhat the same as in quarries. A row of vertical holes is put down to pit floor grade, a few feet back from the face. The amount of dynamite used depends on the height of the face, usually the holes are about two inches in diameter. The sticks of dynamite are dropped down them, so that resting end on end, the bore hole is filled to within one to three feet of the top, the hole is then tightly tamped to the surface.

It is advisable to use electric blasting caps and blasting machine to fire the charges, because the cumulative effect thus obtained produces better results than is possible when holes are fired one at a time with cap and fuse.

In a recent test in a clay pit one man working as described, was able to get down as much clay ready for loading on wagons as six men working with picks could do.

This was considered important in view of the present scarcity and high wages of labor.

CONDITION IN CONSTRUCTION INDUSTRY

By Ernest T. Trigg,

President of the National Federation of Construction Industries in his address as Presiding Officer of the National Conference on Concrete House Construction.

It has given me pleasure, as the president of the National Federation of Construction Industries, to accept the honor of the chairmanship of the National Conference on Concrete House Construction. The honor I do not consider as accorded to me personally, nor to the National Federation of Construction Industries, but to an idea fundamental at this time to the construction industry of America, which during the year just closed has grown from a thought discussed around a dinner table to a living organism, the potentiality of which has already been demonstrated. I refer to the comparatively new conception of the construction industry as a composite whole which has come into the minds of the construction interests, not only of the United States, but of Canada, Great Britain, France and other countries. For it is true that in all these countries at about the same time the construction interests have come to realize the necessity of co-ordinated action and a central organization, through which these interests may become articulate in their relationships to the government, consumers and laborer, and through which also additional effectiveness may be obtained within the industry by virtue of the co-operative action of its several divisions.

It is therefore gratifying to me that I, who chance at the moment to be the president of the federation which is the embodiment of this new thought of co-operative action on the part of many divisions of the constructive industry, should be accorded the honor of presiding at this meeting, because of the faith which is evidenced thereby in this new conception of American business.

The past year has been the most critical of any year in the memory of those present, not only in the construction industry, but in practically every line of business. The war came to a termination with startling abruptness. So far as the United States was concerned, we were barely getting into our stride as a warring nation. We had not reached the zenith of our ability in the production of war material, nor had we reached the utter demoralization of non-war business which would have surely been experienced had the war continued for a longer period. On the other hand, we had not reached a point where provisions were actively in process to lead the business of the country back into normal peace-time channels. Someone has described the condition of business immediately following the armistice as one of almost total paralysis.

Business in general experienced these conditions, but the construction industry was particularly beset with difficulty, not only because it was affected as were all lines of industry, but in addition because, since construction is essentially a peace-time activity, the wheels of the industry had largely stopped, personnel was disorganized and in many cases it was a matter of beginning in the rehabilitation of the industry at the very ground. We can never know how much of the injury worked upon the construction industry by government regulation was justified. The requirements of the government for material, fuel, transportation, finance and labor were perhaps reflected more drastically in the construction industry than in any other branch of business; but we had sons over there, where the crisis of the world was focused in a sharp, hot point of the most bitter contention man has ever experienced; we believed in American institutions; and we were not disposed to do anything which might even indirectly minimize the safety of our blood or of these institutions which we love. There were some instances where construction interests were able to transform their activities into those contributing to the prosecution of the war. There were others where the government actually required construction materials, but in general the construction industry, at the beginning of the year 1919, found itself in a condition of utter disorganization.

The story of its recovery is familiar to all of you. The path which it has followed during the past year has been full of pitfalls. The rapidity with which it has returned approximately to normal conditions is a monument not only to the genius of the leaders in our own industry, but to the American people as a whole, for we are interdependent in all of our business relations.

The year 1919 has been a year of intensive advertising. This advertising, to a large degree, has been of a new kind. We have not so much advertised our wares as ideas which it was necessary to inculcate in the minds of the people of this nation before business could again be set going. The advertising has accordingly been largely group advertising, or, to speak more exactly, educational propaganda organized and paid for by the business interests, which were bound to suffer if they could not put their arguments across in the popular mind. It is to the credit of American business that the educational propaganda which has been put out during the past year has been honest in its intention, logical in its argument and, as latterly demonstrated, sound in its promises. It is probable that the American nation has never seen so great an educational campaign along any line as that which was waged to convince the American people that the then existing price level would not be soon reduced.

There was a period early in the year when nearly everyone believed that prices would shortly decline. As we all know, a declining market is not a healthful environment for business. The belief in the imminence of price decline was so universal that an attempt was made to pass through an imaginary maximum period of decline at once, in order that business might resume upon an ascending market. For a time it was hoped that through the efforts of the Industrial Board of the United States Department of Commerce such an object could be achieved. The failure of the board to realize its purpose was undoubtedly a strong argument in favor of the permanency of higher price levels. An understanding of the psychology of the wage earner, of international financial conditions, of the advanced standards of living which had developed during the war and of the depleted condition of stocks of material eventually made it perfectly apparent that prices could not be expected to decline, but that in many instances they would probably advance. The educational campaign which resulted from the realization of these fundamental facts was undoubtedly primarily responsible for the quick resumption of business. The construction industry had an important part in the campaign, and supplemented it with other campaigns, such, for instance, as the "Own Your Own Home" movement in which all construction interests co-operated and which realized the most far-reaching results.

The National Conference on Concrete House Construction is an educational campaign in which all business interests vitally concerned therewith are co-operating. You are seeking to establish in the minds of the people of the United States an idea which you believe to be fundamentally sound and the realization of which you expect to benefit not so much yourselves but the public at large. The American nation is notorious in the volume of its fire losses. You are seeking to show a way by which the capital wealth of the United States may be conserved. It is an interesting commentary upon American business that insurance interests should co-operate with you in an endeavor to convert the people of this nation to a form of construction where fire hazard is diminished, and that those interests supplying fire protection equipment are also working to educate the American builder and property owner to forms of construction where the danger from loss by fire is decreased.

Construction is as old as civilization. It is older than the records of civilization or, to speak more exactly, the records of the most ancient of our forms of civilization are contained chiefly in the monuments of their constructive art. The massive stone structures of Egypt and the crumbling bricks of ancient Assyria are among the earliest evidences of the industry of man.

Portland cement, like the use of steam, is an acquisition of modern science. It is buried deep in the earth to form foundations of structures which in size fairly rival the pyramids of old. Of it highways are constructed havng the permanence of the stone roads of ancient Rome. It is fashioned in the form of bridges, which are as substantial as native rock and promise to be as enduring. In the decorative art, it is molded into graceful forms with all of the delicate tracery of the artist's hand. This wonderful plastic rock is one of the newest of construction materials. Its use today in common practice is perhaps still crude as compared with what it will be tomorrow. The applied science concerning it is too young for us to suppose that cement has reached its final structure or to imagine all of the uses to which it may be put.

It is peculiarly fitting that you as representatives of one of the newest and most important of construction materials should adopt the advanced methods here evidenced in your business practice. You are assembled, I take it, for a number of reasons. You desire to wage an educational campaign. You wish to sell the people of America an idea. At the same time you are not willing to rest upon the laurels which you have so fairly won, but are determined if possible to advance your art to even higher stages and to instruct your workmen in the methods by which most creditable results may be obtained. You have common interests. You are willing to work in unity. You are here to exchange the knowledge and experience any ideas which have come to you since you last met together. You desire, if possible, to seek out new means of research which shall advantage not only you but your public. This is an excellent illustration of the motive which should prompt all of us in the construction industry, for whether we are interested in cement or brick or steel or preservative materials or lumber or lime or building hardware, or anyone of a hundred other things entering into construction today, we are all members of one great industry, the greatest industry in the United States, and hence in the world, the industry which is supreme in the production of those things which remain permanent in the possession of the people—of the capital wealth of the nation. It is this thought which has led the federation to adopt the pyramid as a symbol of permanence and stability.

I say we are members of the greatest industry in the world. In normal times the construction industry of the United States produces three billion dollars of added permanent taxable wealth annually. It supplies more than one-quarter of the railroad tonnage of the country. It employs more men than any other industry. Its activities are extended into the smallest communities; its influence is felt in many lines of business not directly connected with it.

We have issued from the travail of a great war, which has abruptly swept aside some of our oldest traditions. Business is advancing along new lines. International relationships have taken on new aspects. The methods by which we must carry on our business in the future are aptly illustrated by the spirit which prompts this conference. This spirit is one of working together for the common good of those in your industry and of your patrons.

The present is a day of violent anomalies. Leaving aside the question of the purchasing power of a dollar—which in the final analysis is purely relative—we find that there is universally a demand for better living conditions, accompanied by an equally insistent demand for more hours of leisure. If at any time in the history of a people the standard of living is suddenly elevated to a new plane, the effect economically is the same as if there had been a sudden addition to the population of millions of non-producing consumers. The corollary of a higher standard of living, which is most laudable in itself, is undeniably increased production. We cannot consume that which is not produced. If we would have more of this world's goods, as a nation of over one hundred million souls, we must produce more goods. It is not a question of our individual purchasing power. We cannot buy that which does not exist. It is emphatically a question of our collective producing ability; and it is a fact, according to those who should be in a position to know, that while the per capita demand for commodities is increasing in a way never before experienced, the per capita production of commodities is decreasing. If by the magic of some Aladdin's lamp we were to be able suddenly to place in the hands of every person in the United States a million dollars in gold, the condition whereof I speak would not be altered in the slightest degree.

If the new price level is approximately permanent, our business, other things being equal, can continue unhampered. The significance of the new price level, excepting considerations of international exchange, involves only the larger circulation of currency; but the relationship of production to consumption, if the latter is larger than the former, must inevitably result in ruin through the opportunity thereby created for the further exploitation in price of the commodities which are available. So long as consumption exceeds production the opportunity for profiteering not only exists but is strongly tempting.

The National Federation of Construction Industries, realizing this condition, has warned the component elements of the industry from time to time as to the danger to the public welfare which is inherent in further increases in price; and I am happy to say that notwithstanding the fact that in many instances demand has exceeded supply, the percentage advance in the cost of construction materials has been kept well below the average of the advance in price of all commodities.

The questions of thrift and of production are of transcendent importance to the public welfare at this time. They have called for an educational propaganda which is still in process, and which in some particulars is more difficult than that which related to the permanency of the new price level. Until a proper psychological balance shall have been restored in the minds of our people as to these two economic factors of production and consumption, our nation is in danger. Until this balance shall have been restored, we shall remain in what some have chosen to call the reconstruction period, during which periods our only hope lies in concerted action, not for our individual good but for our collective welfare.

There are other strong considerations which demand our attention. We are

approaching a time when by constitutional provision we shall determine upon the political leadership of our government for the next ensuing period of four years. It is a period which will be marked by decisions and determinations of policy of the most far-reaching importance. The government has played a more intimate part in the business affairs of the nation during the past few years than ever before in our memory, and it is apparent that to some degree at least this intimate relationship will continue for some time to come. Business is not, as some of the uninformed would tell us, an affair of capital. The conditions of business affect the whole people and upon its proper guidance depends the welfare of all of us. It also involves, to a greater degree than ever before, questions of foreign relationships. The unprecedented condition of world finance and exchange requires in its handling the highest ability. The leadership of our country and the formulation of policies during the immediate future should not be left to professional politicians or theorists. Our final emergence from a broad plane of substantial economic security as a nation is conditioned upon the same quality of administrative guidance which characterizes any well organized and operated business. The situation which confronts us calls most emphatically for a business man of the highest order as the next president of the United States, who will surround himself with cabinet officers of recognized administrative genius.

The present is not a time for political spoils or partisanship or petty jealousies. Our need for concerted action to accomplish the restoration of the country to its former strength and stability was never exceeded by the requirements for unity of endeavor during the war. Notwithstanding this fact, strong partisanship is evidenced at the present moment. Many of our political leaders of both parties, apparently heedless of the seriousness of present conditions, are engrossed with the search for party issues which will insure factional success, while organized labor seeks to discover a method by which the government may be deprived of the elective service of American citizens who do not bear the symbol of class rule—the union label.

These are considerations which make it not only desirable but necessary that as business men we shall give more attention to matters not immediately concerned with our business. The spirit which prompts the National Conference on Concrete House Construction is one of unity. It is a spirit which should actuate us even in larger groups of interests than are here represented. The combined construction industry, when it is completely organized, will become one of the most powerful forces of the business world.

I am reminded of a quotation which I saw a few days ago: "He who builds for himself alone is a complete failure, even though his towers touch the sky and death breaks his grasp on a billion." Your assembling here is a testimony of your belief in the ideal of co-operation. For this reason, it affords me a peculiar pleasure as chairman of your conference to welcome you here and to extend to you my most sincere hope that you may accomplish to the fullest degree those things of which you are so eminently worthy.

EFFECT OF SEA WATER ON CONCRETE STRUCTURES

The Society of German Portland Cement Manufacturers, in collaboration with the Material Testing Bureau at Lichterfelde and the Hydraulic Works Inspection Department at Husum, on the island of Sylt, have been experimenting for about 20 years in order to discover the most suitable mixture for concrete for sea-water structures. In this connection Dr. Gary has recently published a detailed report in a communication of the Material Testing Bureau, the conclusions of which are given as follows in Mitteilungen des Reichsbundes Deutscher Technik.

In order to obtain suitably strong structures in sea water, it is necessary to use cement which is as rich as possible in silicates, but poor in kaolin and iron oxide. Such cements, when at the same time they are rich in lime, can be considerably increased in value by adding certain quantities of trass. The decisive factor, however, for the permanence of concrete structures in the sea is the use of mixtures which are as dense as possible and impervious to sea water, while at the same time sufficient external hardening should be given to the substances before they are placed in the sea by exposing them to heat and to moist air. Concrete, the mortar of which contains more than 66 2-3 per cent. of sand, will generally not show the necessary density to enable it to stand attacks by sea water for any length of time.—Engineering and Contracting.

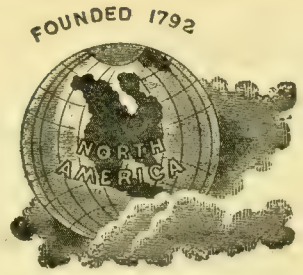
ARCHITECT TALKS ON ADVERTISING AND FEES.

An interesting meeting of the Idaho Architectural Association was held recently at which was discussed some of the more perplexing problems confronting the architect today. There were twenty-five architects in attendance and the meeting was presided over by Mr. Burton E. Morse of Twin Falls, state chairman of the national post-war committee on architectural practice.

Prominent among the speakers at the convention was Mr. Charles H. Whitaker, a member of the post-war committee, who explained the purposes of the post-war committee. He outlined the guilds of the old days, wherein the workman was apprenticed for so many years before he was permitted to work for himself and said if architects would take more care of their apprentices today and the apprentice could be made to realize the amount of valuable information he was acquiring, it would be better for the profession, as these apprentices will be the architects of tomorrow.



In his exhaustive address Mr. Fred F. Wilson of Bozeman, Mont., touched particularly upon two important phases of the architect's work—advertising and fees. He mentionel the fact that in so many public write-ups of buildings everyone else was mentioned except the architect, which was far from fair, and he outlined ways in which the architect should advertise, particularly in his education of the public. In this connection he cited the instance of a school board in one of the Montana counties which sent specifications to fourteen architects for a building to cost $27,000, which included accessories which could not be included under $37,000. Mr. Wilson said he so stated to the board as did others, but an inside man made a bid of $27,000 and was given the contract and later the board was obliged to pay $43,000 for the building. This was a case where the public should have been educated to knowing what things actually cost and to having faith in home architects.

Another thing which works a great hardship on architects is getting a uniform commission on the cost of the building, whether it be large or small, and nothing for preliminary sketches. He cited the instance of plans for a $15,000 house on which he made so many sketches to suit the wife of the family that it took $600 worth of his time before the building was commenced. With a 6 per cent. commission it was easy to see how much ahead he was, he said.

Mr. Paul Davis of the department of law enforcement outlined the state's registration laws and showed the Idaho laws relating to the licensing of architects was almost a model law, that the result of this law will be to protect the public and raise the standard of the profession.

Mr. Davis suggested that a bill be introduced into the next legislature, defining just who can and who cannot practice architecture in Idaho. As an illustration of the need of this he mentioned the fact that certain lumber companies had plans drawn for houses with a careful estimate of the lumber needed and the company threw in the plans if the lumber was purchased. The new definition would determine whether these plans could be used or not.—*Architect and Builder.*

805-7-9 MASTER STREET, PHILADELPHIA
Kensington 6652 - - - - Park 35

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

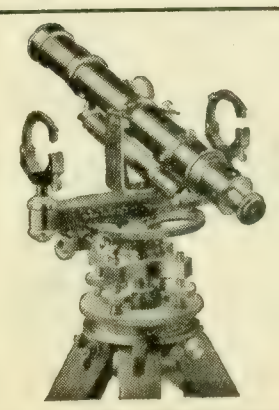
Cheapest and the best

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

WHEELBARROWS AND DRAG SCRAPERS

Results and Tangible Dollars and Cents Saving Combined

It accomplishes both, therefore, you can specify it with this assurance. *Experience proves both.* Everywhere it is used–on all inside surfaces–it gives a first-class, hard finish that stands the test of time. It is economical not only to *use*, but in actual *low cost*, as compared with other paints. *It goes twice as far.* Is does not peel nor rub off. White and colors.
By the bbl., 10c lb. (40c gallon); smaller lots, 12c lb. (48c gallon). Special price to contractors. *Liberal testing sample free to prospective big users.*

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

SHEETROCK

The Contractor's Choice

FOR years you have been looking for this standard wall in unit form. You have wanted a unit material rigid, uniform and fire-resistive.

Here it is—Sheetrock.

A sheet of pure gypsum rock, Sheetrock won't warp, shrink or buckle. Sheetrock will not burn.

On all framework and in all moderate-priced construction, Sheetrock makes a job you can be proud of. It pleases the owner.

You can go over the work with him—point out how evenly the units of Sheetrock join in a flat surface—remind him it will not crack or warp or buckle or shrink—remind him it will resist fire—because it is a sheet of gypsum rock—Sheetrock.

And the longer he lives with it, the more that customer is going to value Sheetrock and respect your good judgement in using durable, good-looking, economical Sheetrock. Whenever he has any other building to do, he will naturally think of you first.

Look for chances to use Sheetrock on alteration and repair work. Sheetrock comes in broad, flat compact sections, 32 and 48 inch widths—ceiling high. It cuts, saws and nails like soft pine.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

KLEIN STOVE CO.

Front St. & Fairmount Ave.

Bell Phone, Market 3879 **PHILADELPHIA, PA.**

CARTER CONCRETE

The Kind That Lasts

Carter Concrete **PAVEMENTS, FLOORS, CONSTRUCTION—BUILT BY SPECIALISTS SINCE 1888—BUILT TO PREVENT CRACKING, CRUMBLING and DECAY—BUILT TO LAST.**

ORIGINAL COST OF *Carter Concrete* LOW—UPKEEP COST NEGLIGIBLE.

SPECIALISTS IN CONCRETE ROADWAYS

One of our Engineers will help you in Concrete Problems and gladly give you an Estimate.

CARTER PAVING COMPANY

639-41 N. 18th St., Philadelphia, Pa.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

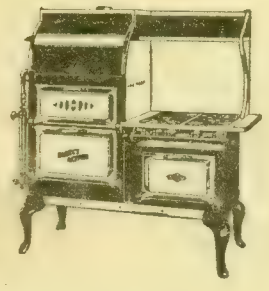
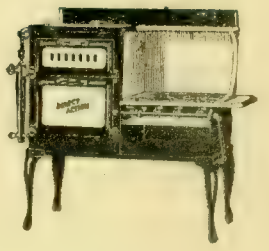
SIZES FURNISHED ON APPLICATION



One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

As The Editor Sees It

DISORDER, unrest, underproduction and strikes abound throughout the country. Many thoughtful business men are giving much time to perfect plans tending to alleviate these conditions and to effect greater harmoney between employers and employees. Activities of the Iron League of Philadelphia have been particularly noticeable recently and an endeavor has been made to effect open shop in the various iron industries. The following communication, under date of April 26, has been received by the GUIDE, and is indicative of the sentiment of many associations connected with the building industry:

"Since conditions in Philadelphia are similar in many respects to those in New York, the enclosed letter will be of special interest. The same attempt has been made here,—and has not been abandoned,—to put the building industry upon a general closed-shop basis. The Iron League trade here, as in New York, has organized to resist this effort and to maintain the right to employ workers without discrimination as between union and non-union men. It is now generally admitted in New York that the effort to force a closed shop in the iron erection has failed.

The Iron contractors here have the same legal rights as relied upon by the iron contractors in New York. The same Iron Workers' Union is involved, and in its "agreements" to take effect May 1st in Philadelphia the demands of this union absolutely preclude any control of the contractor over the work or its cost. A closed shop is demanded, foremen must be members of the union, record of individual work cannot be kept, sympathetic strikes are permitted, piecework is forbidden, etc., etc. In insisting upon tht right to employ without discrimination and in refusing to surrender control of their work to an organization of this kind, the Iron League of Philadelphia asks the support of all right-thinking citizens.

Many general contractors and architects are inserting clauses in contracts providing for the closed shop and are acting against the interests of the owner as well as of the entire community.

The sympathetic strike is unlawful. Mr. Gompers, in the System Magazine for April, says, "The sympathetic strike is absolutely against the principles of the American Federation of Labor. It has nothing to do with constructive union labor and is a weapon evolved by anti-trade unionists to pave the way for the general strike with which they hope to destroy the present basis of society."

The symypathetic strike is the curse of the Building industry. Why should it not be eliminated? Why should not all the builders and owners, whether working upon a closed or open-shop basis, stand firmly together against sympathetic strike whenever it shows itself? Can this not be done in Philadelphia?

The following resolutions were unanimously adopted by the Ironi League of Philadelphia, at meeting held April 12, 1920:

"Whereas, the sympathetic strike is unlawful and anti-social and involves unwarranted attack on innocent third parties who have no interest in and no control over the issues involved in the original controversy; and

Whereas, the use of the sympathetic strike in the building industry has increased until it has become a serious menace to legitimate building enterprise and to the welfare of the community; and

Whereas, the President of the American Federation of Labor has publicly stated that "a sympathetic strike is absolutely against the principles of the American Federation of Labor. It has nothing to do with constructive union labor and is a weapon involved by the anti-trade unionists to pave the way for the general strike with which they hope to destroy the present basis of society"; be it

RESOLVED: That the sympathetic strike should be eliminated from the building industry of Philadelphia, and that all those interested in building operations in the city, whether their work be conducted under union agreements or otherwise, should co-operate to prevent and oppose

DRAWING MATERIALS

BLUE PRINTS

sympathetic strikes in the future whenever and wherever they arise. Be it further

RESOLVED: That a systematic effort be made to secure the co-operation of those engaged in the building industry and of other business interests of the city, and also the interest and support of the general public in such movement."

Concurrent with the action of the Iron League, at the special Corporation meeting of the Builders Exchange, held at the Bellevue-Stratford Hotel, May 29th, the members of the Exchange passed a resolution disapproving of the sympathetic strike for any cause whatsoever.

Certainly the sentiment of the public is against strikes in general and unless the journeymen co-operate by keeping on the job the building shortage will not be relieved and rents and prices of houses will not decline, but rather advance and the vicious circle of high cost of living grow larger.

* * *

STABILIZING BUILDING PRICES.

Leading the lumber and building material dealers of Chicago, Edward Hines has started a movement to stabilize the prices of all kinds of building materials in order to cut down the cost of building and to settle the housing and rent questions, both of which have had a discouraging effect on the social and economic life of the city.

Mr. Hines is quite sure that the material men will do their share to bring about the most wonderful construction activity ever experienced, but deprecates the action of the building trades unions whose members are negotiating for a wage increase from $1 to $1.25 an hour. In the opinion of Mr. Hines the question of how great or how limited building operations are going to be this year is up to organized labor.

The Hines Lumber Company, which handles approximately half of the lumber business in Chicago and its suburbs, sent out circulars to 10,000 big users of lumber notifying them that if the present wage in the building trades remains, it guarantees not to raise its prices for at least six months. Other material men have agreed to do likewise.

"There is plenty of money in Chicago to build the homes now needed," said Mr. Hines. "But the movement in the building trades to raise wages to $1.25 an hour has already caused a serious stoppage in building. The banks and the building loan men have started to retrench. Unless something is done there will be no loans and no building.

"First of all, there is no need now for increased wages. We have 5,000 men in the woods, and we have noted a steady drop in the price of meat, flour aind other necessities since January 1. The present wage of $1 an hour is adequate and the men will make much more if they keep it than they would with the increase and the stoppage of building.

"There is talk in the sash door, and interior trim factories of increasing to the same wage as the building trades. This means an increase of 40 per cent. for those men. The men in the planing mills are demanding the same salary also, a raise of 42 per cent. for them. Then the teamsters and the men in the lumber yards, who are now satisfied, would demand more moiney. It would mean that the whole industrial fabric would be disturbed by numberless strikes.

"The labor situation should be settled now for the next two years. If we let things go it will mean that the serious housing question will become almost unbearable. Only by stabilizing prices can rents be regulated and profiteering stopped. Thousands of Chicagoans want to build. But it will take only a little more to stop entirely all building loans."

William Schlake, president of the Illinois Brick Company, said the price of brick will remain the same for at least six months. Cement men also agreed to co-operate in the stabilizing of prices.

"If the men in the building trades can see that their salvation lies in holding to their present scale," said Mr. Hines, "they will have work the year round. There was never before so much sentiment in favor of building homes and the building situation was never before so critical as at present.

J. KISTERBOCK & SON CHANGES OWNERS.

James J. Quigley & Son, 1342 Ridge avenue, Philadelphia, Pa., have purchased the business formerly conducted by J. Kisterbock & Son at 2002 Market street. The Quigley firm has been doing a general business in heating, ranges, roofing and metal work, and by the deal referred to it comes into possession of the entire stock of warm-air heating, range and fireplace equipment, as well as the patterns of the Kitsterbock concern.

The business will be conducted in the future from the Ridge avenue address and J. Regan, who has been connected with the house of Kisterbock for many years as general superintendent will be associated with James J. Quigley & Son, as will the skilled workmen who have been working with him.

BOARD TO SETTLE DISPUTES

WILL DISTRIBUTE WORK AMONG BUILDING TRADE UNIONS.

The National Board of Jurisdictional Awards will meet in Washington on Monday, Tuesday and Wednesday of this week to take up some of the many questions that are now in dispute among the building trades. This consists in distributing the work to the unions, which, in the judgment of the board, are logically the ones to do it. As an instance, one of the questions now in dispute is who shall put the asbestos covering on boilers, the plasterers or the asbestos workers?

Many similar cases are always in dispute, and the national board has been appointed to take care and settle the same. Coloned John R. Wiggins, the only representative from Philadelphia, will attend the three-days' session.

All these Stone & Webster buildings carry Barrett Specification Roofs—

READ this letter from the company which built the 23 buildings shown above:

STONE & WEBSTER
147 MILK ST. BOSTON

June 13, 1919.

The Barrett Company, New York

We are sending you a collection of photographs showing the types of structures on which we have used Barrett Specification Roofs. The collection includes industrial plants and buildings, warehouses, power stations, substations, office and monumental buildings, chemical works, etc., and it seems to us that this exhibit is better evidence of our satisfaction with your product than anything we might say.

Stone & Webster

For a great construction company like Stone & Webster, to use Barrett Specification Roofs is convincing proof of the correctness of the Barrett Specification principle of roof construction, and shows their absolute confidence in Barrett materials and Barrett Service.

Stone & Webster, as well as other important construction companies, recommend Barrett Specification Roofs because:

1—From start to finish they are assured of getting just the kind of roof they specify, with no chances for "skimping" or the substitution of inferior materials.

2—They know that all contractors are bidding on an equal basis on a standard roofing of the highest quality.

3—Our "Free Inspection Service" protects them, by placing on *us* the burden of seeing that the owner gets what he pays for and that the materials are properly applied.

4—And last and most important we furnish free a Surety Bond (details on request) which absolutely protects the owner from roofing maintenance and expense.

Is it any wonder that The Barrett Specification type of roof covers more of the prominent structures of the country than any other kind?

Copy of Barrett Specification with roofing diagrams sent free, upon request, to any one interested.

The Barrett Company

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

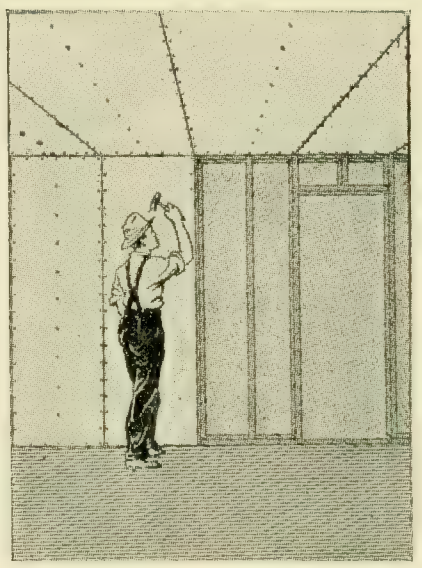
Our specialty is Portland Cement that will stick and pass the City Department. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.



SHEETROCK
WALL BOARD

SHEETROCK is not only cheaper than lath and plaster, but saves time and labor. It's made of pure gypsum rock, can be papered or painted as well as plaster, is stronger than wood, and won't burn, warp or shrink.

This scientific, fireproof wall board fills any plastering need. Instead of having to nail on lath and then troweling, and waiting for your scratch coat to dry, and your finishing coats to dry, you can nail Sheetrock to walls or ceilings and they are ready for paint, paper or panels.

Ask for a sample and you'll see for yourself why the Government has used over 5,000,000 feet of Sheetrock.

Greatly Outlives Wood Wall Boards and Costs About the Same

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Phila. Both 'phones.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

Three-story building, 40x110 feet, remodeling heating, electric work, tile and marble work, flush bulks, new partitions, plumbing. Contract awarded to Consolidated Eng. Co., Baltimore, Md.

Community House (alts.), 1914 Madison avenue, Baltimore, Md. Architect, Louis Levi, Real Estate Trust Building, Philadelphia. Owners, Madison Avenue Temple, on premises. Brick, 4 stories, 40x150 feet, general alterations. Contract awarded to Christian F. Richter, 38 South Liberty street, Baltimore, Md.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf. Delaware River, Philadelphia.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

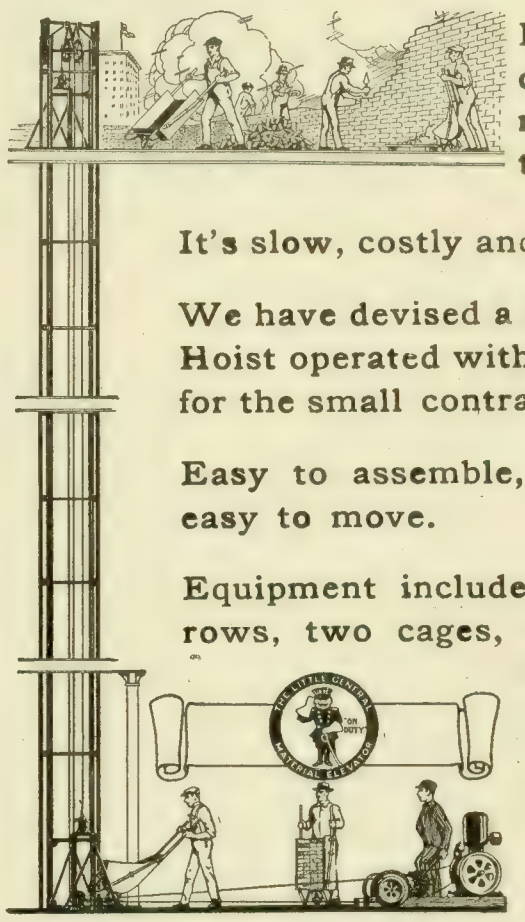
A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.



Sole Representative of Mack & Pennsylvania Clay Works

JOHN S. E. PARDEE & CO.

CARRY THE HOD!

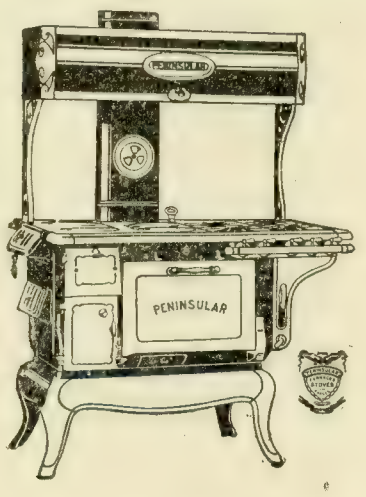
Do you use the hod carrying method of raising bricks, mortar and cement?

It's slow, costly and uncertain.

We have devised a small, inexpensive Hoist operated with a gasoline engine for the small contractor.

Easy to assemble, easy to operate, easy to move.

Equipment includes nine wheel barrows, two cages, iron guides, hoist, engine and cable.



Twenty-five in operation in Phila.

Phone us for Details

Service Equipment Company

Bourse Building, Philadelphia, Pa.

Lombard 490

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

KLEIN STOVE CO.

Front St. & Fairmount Ave.

Bell Phone, Market 3879 **PHILADELPHIA, PA.**

CARTER CONCRETE

The Kind That Lasts

Carter Concrete **PAVEMENTS, FLOORS, CONSTRUCTION—BUILT BY SPECIALISTS SINCE 1888—BUILT TO PREVENT CRACKING, CRUMBLING and DECAY—BUILT TO LAST.**

ORIGINAL COST OF *Carter Concrete* LOW—UPKEEP COST NEGLIGIBLE.

SPECIALISTS IN CONCRETE ROADWAYS

One of our Engineers will help you in Concrete Problems and gladly give you an Estimate.

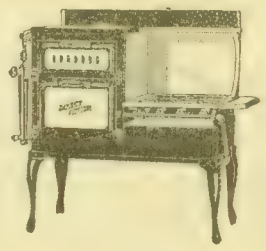
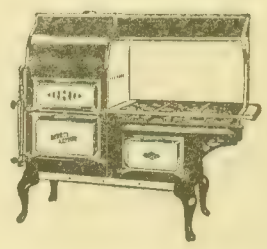
P. H. FAIRLAMB CO. - 115 to 121 S. 30th Street Philadelphia



One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the



Direct Action Gas Range

is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St., Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

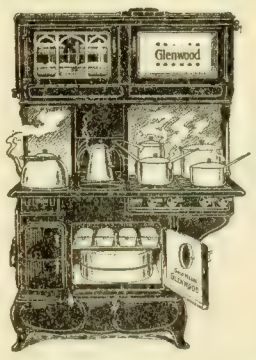
THE MOST FOR THE MONEY

Your clients don't want a cheap water heater—they want hot water economically.



There's a difference. Cheap water heaters cost too much to have around.

Humphrey Automatic Gas Water Heater service appeals to the householder as the ideal, dependable hot water supply. Get the details. In the interest of your patrons specify the Humphrey.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintaims an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

Carpenters and Builders

Here is a Better Woodworker

The Hutchinson Woodworker

A simpler, better, more durable machine. It will cross cut, rip, bore, dado, miter. No over-hanging shaft, no complicated belt. Easy to operate—it cuts at any angle.

One man with this machine can do as much work as six under ordinary conditions.

As The Editor Sees It

GEORGE M. SEGLIN, Expert Estimator, Department of Architecture, State of New York, asks in the *American Contractor,* "Shall We Build Now?"

This is a very pertinent question, and one that interests everybody in the building trades.

"Shall we build now? and its corollaries are questions that can safely be estimated to be in the minds of 80 per cent. of the thinking men and women, no matter what their walk in life may be," says Mr. Seglin.

The home-seeker is thinking whether it is advisable to start building his home now. The manufacturer is thinking whether it is best for him to build his additions and new plants now. The landowner is thinking whether he should improve his vacant property with income bearing buildings and stop paying taxes on what yields him no return. The investor is thinking whether it is advisable to invest his capital in building projects, for the returns are certainly more than attractive. The rent payer is thinking why he cannot get a desirable place to live in if he is willing to pay more than he ever paid before. And the architect and engineer is thinking: "Shall I advise my client to build?"

But, as always, there are two sides to every problem and this one is no exception. The rent payer is right in his contention that he is paying more; in fact returns on realty today are easily 50 per cent. to 100 per cent. greater and more certain than they were a very few years ago. Normally that would be sufficient reason for the homeseeker who would have to pay that increased rental if he did not build his home, to go right ahead with his cottage. It would also be ample reason for the landowner and investor to start their building operations immediately. If this were the only phase to the question it would be settled very easily. There is an absolute need for all kinds of buildings and the returns are both high and certain. But just as soon as that is determined comes the other phase of the problem—everything costs so much more to produce, and aren't these high prices only here for a short while?—so that after we have invested our capital will we find that the bottom has dropped out of the market and leave us with buildings on our hands that are worth only half what they cost to construct? Then there is another phase to this problem, and that is, have prices reached their peak or are they going still higher?

To begin with, the tendency has been constantly upwards until at the beginning of this year we find that building materials have risen an average of 171 per cent. over what they were in 1915, while labor has risen 71 per cent. over what it was in 1915. The significance of the discrepancy in the rise between labor and material we will discuss later; for the present it is sufficient to note that the entire tendency is upwards with practically no setback; in fact, the tendency is still upward, aind at the date of this writing, April 1, 1920, we find labor and material still climbing upwards; in fact material has climbed to an increase of 195 per cent. and labor to 88 per cent. Now is this rise caused by the vast amount of permanent building that has prevailed since 1915? Of course not. As a matter of fact, the nation is 200 per cent. behind in the normal amount of its production of permanent construction. When the world war began in August of 1914 this country was just going through a period of depression with construction work at its lowest. Then, after the country overcame its pessimism as to the effect of the war upon the material welfare of this nation, it became feverishly busy putting up factories of a more or less temporary and special nature to house war industries. After that came our entrance into the war and with it all private construction ceased. So, with the signing of the armistice, we found ourselves practically four years behind in construction. Further, there was also a shortage of building materials due to the insatiable demands of our war authorities, which not only consumed all the available supply as fast as it was produced, but also absorbed our entire surplus to such an

BLUE PRINTS

extent that with the end of the war the only visible supply of material on hand was the comparatively little material left over at the various cantonments and war supply bases.

Thus, with the cessation of hostilities and the return and release of our vast army, we began facing a threefold problem:

First, where to get homes that should have been built to take care of the normal increase in population.

Second, where to get the material necessary ot build these homes.

Third, where to get the men with which to build these homes.

We began to feel this dearth of homes even before the signing of the armistice, but it has become acute since then and it is becoming worse every day; in fact, it has reached such a state that the Legislature of the State of New York has found it necessary to pass remedial measures to try to curb the action of rent profiteers who are taking advantage of this shortage to gouge the rent payer. Practically all the other States are facing the same problem in one form or another. Now what is necessary is enough houses to take care of the normal increase each year and enough more to overcome this 200 per cent. shortage. Therefore, if this nation made a superhuman effort and doubled its production each year, it would take four years to overcome this shortage, and then what would we have? We would have a sufficient supply to just take care of our increased population. But this does not mean that the property owner would have to cut hs legitimate profits to rent his property, for it is only when an over supply is reached that this surplus becomes vacant. Only when this condition is reached does it become a contest as to whose property shall be within this surplus, with the law of supply and demand stepping in and causing a drop in prices.

But this ideal condition of production is absolutely impossible, due to a number of various reasons. One of the principal reasons is that all of the forms of construction have suffered for the same reason that the home has suffered. For example, take the Hospital and Custodial problems of New York. They are ten years behind their needs, and it will take all of that to begin to solve it. Then there is the vast amount of labor required to convert the factories from a war to peace time basis, besides providing housing conditions for all the industries that have been curtailed and fairly stifled to provide room for war activities. So that we find that the various State, Municipal and Commercial needs will demand a big proportion of the available construction, leaving very little for home construction. In fact, this need is so urgent that it is questionable whether there will be possible for some time to come any surplus home construction at all. So we see that, while the most optimistic view would place the probable return to normal at four years, the actual return to nearly normal would be nearer six to seven years. By normal I mean a supply sufficient to take care of the demand comfortably and a production ample to take care of the average increase.

Now comes the question of building material. Where shall we get the material with which to supply the abnormal demand? The signing of the armistice found the material markets stripped of all stock, aind the production of the factories converting the raw material into building materials cut to a fraction of their producing capacity. With the removal of war time restrictions these factories had to begin readjusting themselves and try to collect their organizations together. Organizations that had become disintegrated, both by the draft and by the attraction to the higher pay offered by the war industries. The supply of labor was further depleted by emigration, immediately after the signing of the armistice, with their savings from the almost fabulous wages paid them.

So we find that all the surplus of both labor and material which should have tided us over this period of readjustment was gone, consumed by the feverish demands of the government. Thus we find the inevitable laws of supply and demand stepping in again the price curve keeps continually going upwards. The only time we can hope to see this continual rise cease is when the supply will begin to equal the demand. And we can only begin to see a recession in price when our surplus stock of material begins to rise. This is, without doubt, many years off. For even if the supply became normal it would not begin to meet the demand, a demand which is attempting to satisfy and overcome a four-year famine. In fact, it would require an actual doubling in production for four years to just about overcome this shortage. But such a volume of production is utterly impossible when we take cognizance of the fact that these industries have to face both a shortage in man-power and competition for raw material with other industries. Therefore it will be nearer six or seven years before the building material markets will be able to hope to begin accumulating a surplus, and then, and only then, can we hope to see any recession in prices. But this recession can only be a gradual one, as the surplus can only be acquired gradually over a period of years and the price can only be hoped to keep receding as the surplus grows, or, in other words, I do not think we can see a real drop in price for at least eight to ten years.

Lastly, comes the problem of labor. Even if we had the material, where could we get the labor with which to install this material. The first serious need is for skilled mechanics, a need which is beginning to be felt more acutely every day. This shortage in skilled labor is due to many reasons. First, is the laxness that prevailed, even before 1915, in the way the young man was trained for the various trades and also the poor outlook for the future after he did learn the trade. So that when the war industries came along with their seemingly fabulous wages for work that required no training, the young men flocked to these industries. Then came the draft and took the young men off and so we find a real need for skilled mechanics. This will cause a further rise in price of labor, as the youth of today will have to be offered something at least as good as he can get elsewhere before he can be induced to learn a trade. This fact has already been recognized in other industries and so we find that we are facing a possible further rise in the cost of labor, probably one that will more nearly equal the rise in the cost of materials and the rise of the cost of labor in other industries. Moreover, the emigration of vast numbers of foreign laborers and the practical stoppage of immigration has caused an acute shortage of unskilled laborers, an absolute necessity in any building operation.

Further, this probable rise in the wages of labor becomes more probable when you compare the price curves of both labor and material. Normally labor represents approximately one-third the cost of a building operation, but with the uneven rise in the cost of these two elements we find that labor now represents only 25 per cent. of the cost of an operation. Thus we find that either the price of materials must come down or labor will have to go up to equal the rise in price of materials. There is very little likelihood for material to go down, as we have seen earlier in this article and as can be further proven by the quotations on materials in the open market. In fact we can easily see that wages of labor are still going up when you watch the ease with which the building trades are getting their spring demands for increases. As a matter of fact, I do not think this rise in wages will stop until we find the average rise in wages about equals the rise in materials. So taking it all in all, I can see no chance for a drop in demand for at least six to eight years and in cost in not less than ten years. Therefore, my advice would be to build

(Continued on Page 471.)

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Pipe Bending Shop, Master street and Germantown avenue, Philadelphia. Architects, Price & McLanahan, Bellevue Court Building, Philadelphia. Owners, Crane Co., 245 Master street, Philadelphia, and Chicago, Ill. Brick, terra cotta and steel, 1 story, 20x60 feet, gypsum block roof, wood block and pine floors, hollow tile and metal lath, roof ventilatrs, waterproofing, stone foundations, hollow metal sash, rolled steel skylights, fire doors, iron work. Architects taking bids due May 14th. Pringle Borthwick, 8018 Germantown avenue; H. E. Baton, 1713 Sansom street; John Gill & Co., Otis Building; F. W. Van Loon, Perry Building; Warren-Moore Co., Colonial Trust Building, and Cramp & Co., Denckla Building, are figuring.

Residence (alts.' to Apartment House, 1806 Erie avenue, Philadelphia. Architect, Edwin L. Rothschild, 1011 Chestnut street, Philadelphia. Owner, Solomon E. Levy, Bulletin Building, Philadelphia. Carpentry, mill work, roof repairs, plumbing, electric work, hardwood floors, hot water heating extension, hardware. Owner taking bids due as soon as possible. Kober Const. Co., Middle City Building, is figuring.

Elevated Stations, Contracts Nos. 557 & 576, Frankford Elevated. Architect, private plans. Owner, City of Philadelphia, City Transit Department, 1211 Chestnut street, Philadelphia. Owners taking bids, due May 18th. Standard Const. Co., 1713 Sansom street; M. H. McCloskey, Jr., Inc., 1620 Thompson street; W. W. Anstine & Co., 1218 Filbert street, Philadelphia, and Conner Bros. & Co., 15 West Ninety-first street, New York City, are figuring.

Station Platforms, Contract No. 571, Frankford Elevated, Philadelphia. Owners, City of Philadelphia, Department of City Transit, 1211 Chestnut street. Owners taking bids due May 18th. George B. Clopp, 3717 Filbert street; Standard Const. Co., 1713 Sansom street; Johns Manville Co., 210 North Broad street; F. J. Beas, 201 North Broad street, Philadelphia, and the Dravo Cont. Co., Pittsburgh, Pa., are figuring.

Office Building, Seventeenth and Cherry streets, Philadelphia. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owners, Sun Oil Company, Chester, Pa. Brick, cut stone, terra cotta, concrete and steel, 12 stories, 84x88x36 feet, asphalt built up roof, marble and cement floors, terra cotta, metal lath, elevators, waterproofing, concrete foundations, steam heating (lighting reserved), hollow metal sash, rolled steel skylights, kalamein and metal doors, iron stairs, iron work. Architect taking bids from Geo. A. Fuller, Widener Building, due May 18th.

Store (alts. and add.), Clearfield and Livingston street, Philadelphia. Architect, J. S. Fuller, 1537 Chestnut street, Philadelphia. Carpentry, mill work, tile work, marble work, parquetry floors, electric lighting. Architect is ready for bids.

Residence (alts.), Southeast Corner Eleventh and Cherry streets, Philadelphia. Architect, private plans. Owners, Philadelphia Lying-in Charity Hospital, Southwest Corner Eleventh and Cherry streets. New bath rooms, tile work, electric lighting, general interior alterations. Owners taking sub-bids.

Store Building (alts.), 119 South Front street, Philadelphia. Architects, DeArmond, Ashmead & Bickley, Franklin Bank Building, Philadelphia. Owners, Jos. Tetley & Co., on premises. New front, general interior and exterior alterations, brick work, plate glass, plumbing, steam heat, electric lighting, electric elevator, plastering. Plans in progress.

Sales and Service Building, Broad and Thompson streets, Philadelphia. Architects, Ballinger & Perrot, 329 South Broad street, Philadelphia. Owner, Nash Agency, care of C. B. Pieronet, 342 North Broad street, Philadelphia. Architect selected. Sketches in progress. Too early for details.

Store, Haines street and Germantown avenue, Philadelphia. Architects, Custer & Gill, 304 Market street, Camden, N. J. Owner, A. D. Frost, on premises. Brick, 1 story, 14x65 feet, slag roof, pine floors, pipeless heater, electric lighting. Architect ready for bids.

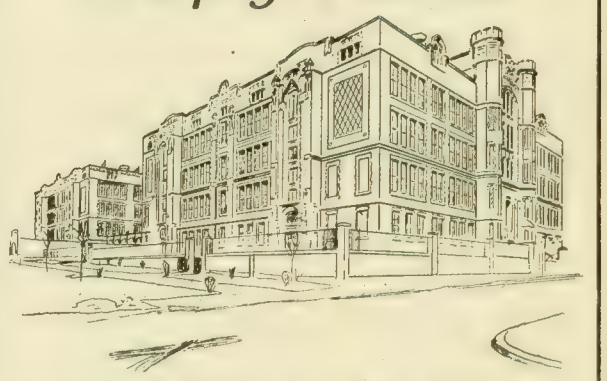
Apartment House (add.), 247-49 South Juniper street, Philadelphia, $125,000. Architects and owners, Simon & Simon, on premises. Brick, 6th, 7th, 8th, 9th and 10th floor addition, 36¾x67½ feet. Plans in progress.

Warehouse, Garage and Stable, Second and Washington avenue, Philadelphia. Architect, Herman H. Kline, 1612 South Fourth street, Philadelphia. Owner, name withheld. Brick, slow burning construction, 1 story, 300x200 feet, slag roof, cement floors, electric lighting, steam heat, rolled steel sash, hollow metal skylights. Plans in progress.

Post Office (alts.), Ninth and Chestnut streets, Philadelphia. Owners, United States Government, Office of Custodian, Ninth and Market streets. Carpentry, mill work, hardware, painting, glazing. Owners taking bids due May 21st. F. W. Van Loon, Perry Building; Joseph F. Price, 2048 Rittenhouse street; Kober Const. Co., 34 South Seventeenth street; Albert Zellfelder, 151 South Broad street; F. L. Hoover & Son, 1023 Cherry street; Thomas C. Trafford, 1613 Sansom street, and F. W. Hosebach, 821 Cherry street, are figuring.

Apartment House, Frankford, Philadelphia. Architects, Antrim & Connaroe, 225 South Sydenham street, Philadelphia. Owner, name withheld. Brick, 3 stories, 45x140 feet, slag roof, pine floors, stone foundations, hot water heat, electric lighting, fire escapes. Architects will be ready for bids in two weeks.

Bridge, South street over Schuylkill River, Philadelphia. Architect, private plans. Owner, City of Philadelphia, Bureau of Surveys, Department of Public Works, care of John C. Winston, Director, Room 746, City Hall, Philadelphia. Owners taking bids due May 28th at noon, Room 216. Bethlehem Steel Co., Morris Building; Hydrex Felt Eng. Co., 4861 North Fifth street; Scherzer Bridge Co., Chicago, Ill.; Snare & Triest, Pennsylvania Building; Arthur McMullin, Finance Building, Philadelphia; Strauss Bascule Bridge Co., New York City, and Eng. & Const. Co., Chicago, Ill., are figuring.



Garage, 1507 North Thirty-third street, Philadelphia, $5,000. Owner, A. Leitvitz, 3214 Columbia avenue, Philadelphia. Brick, 2 stories, 20½x68 feet, 1 story, 21x58 feet, slag roof. Owner will build.

Store and Dwelling (add.), 2239 North Thirtieth street, Philadelphia, $10,000. Architect, private plans. Owner, C. J. Williams, 3200 Arizona street, Philadelphia. Brick, second story add., 16x33 feet, third story add., 11x23 feet, slag roof, electric lighting, interior alterations. Owner will build.

Garages (3), Bryn Mawr avenue and Woodbine avenue, Philadelphia, $1,000 each. Architect, private plans. Owner, Thomas F. Reilly, 2400 Bryn Mawr avenue, Philadelphia. Stone, 1 story, 24½x35 feet, slag roof, cement floor, electric light. Owner will build.

Factory Building, Janney street, North of Ontario street, Philadelphia, $10,000. Architect, private plans. Owner, William Ford, 5024 Penn street, Frankford, Philadelphia. Brick, 1 story, 109x58 feet, and 120x58 feet, slag roof, electric lighting, cement floor and pine floor. Owners will build.

Modern Houses Demand Modern Roofings

PRESENT day living standards demand modern houses with modern roofings. There are none better than the Barrett Everlasting Roofings. They are artistic, staunch, durable and remarkably low in price.

Whether you are building for re-sale or for an owner, you want to give your customer all you can for his money. You want him to be proud that you built his home, for that means future dollars for you.

Barrett Everlastic Roofings will serve you often, as they are adapted to all types of steep-roofed buildings.

Carried by Enterprising Dealers Everywhere.

Everlastic Multi-Shingles.

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades or red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

WHEELBARROWS AND DRAG SCRAPERS

Results and Tangible Dollars and Cents Saving Combined

It accomplishes both, therefore, you can specify it with this assurance. *Experience proves both.* Everywhere it is used–on all inside surfaces–it gives a first-class, hard finish that stands the test of time. It is economical not only to *use*, but in actual *low cost*, as compared with other paints. *It goes twice as far.* Is does not peel nor rub off. White and colors.
By the bbl., 10c lb. (40c gallon); smaller lots, 12c lb. (48c gallon). Special price to contractors. *Liberal testing sample free to prospective big users.*

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

SHEETROCK

The Contractor's Choice

FOR years you have been looking for this standard wall in unit form. You have wanted a unit material rigid, uniform and fire-resistive.

Here it is—Sheetrock.

A sheet of pure gypsum rock, Sheetrock won't warp, shrink or buckle. Sheetrock will not burn.

On all framework and in all moderate-priced construction, Sheetrock makes a job you can be proud of. It pleases the owner.

You can go over the work with him—point out how evenly the units of Sheetrock join in a flat surface—remind him it will not crack or warp or buckle or shrink—remind him it will resist fire—because it is a sheet of gypsum rock—Sheetrock.

And the longer he lives with it, the more that customer is going to value Sheetrock and respect your good judgement in using durable, good-looking, economical Sheetrock. Whenever he has any other building to do, he will naturally think of you first.

Look for chances to use Sheetrock on alteration and repair work. Sheetrock comes in broad, flat compact sections, 32 and 48 inch widths—ceiling high. It cuts, saws and nails like soft pine.

Brick, steel and concrete, 1 and 2 stories, 90x400 deet, 60x70 feet, electric light, hollow metal sash, roof ventilators. Plans in progress.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 5, 1920. Sealed Proposals will be received at this office until 3 P. M., May 20, 1920, and then opened for mezzanine floor and metal shelving in sub-basement store room of United States Treasury Annex, Washington, D. C., in accordance with this specification and drawing No. SA-401, copies of which may be had at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 3, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 1, 1920, for furnishing the labor required in the construction, complete (except mechanical equipment), with materials that will be furnished by the Government, of a laundry building for the United States marine hospital at New York, N. Y. (Stapleton). Drawings and specifications may be obtained from the Supervising Chief Engineer, Room 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 3, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 1, 1920, for the mechanical equipment of the laundry building for the United States Marine Hospital at New York, N. Y. (Stapleton), in accordance with drawings and specifications, copies of which may be obtained from the Supervising Chief Engineer, Room No. 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

(Continued from Page 456.)

and build now, whether it be a modest cottage, or an apartment house, or a factory. High prices are here to stay for a decade anyhow, and the longer we hold off from building the acuter will become the demand and prices will go still higher. But in closing I would like to sound one word of caution both to owner and architect and engineer—avoid specials. Remember the mills and factories have got all they can do to try to supply regular stock material, and so every time you demand and specify a special you are delaying the completion of your project.

Morris & Erskine, architects, formerly at Crozer Building, Philadelphia, have moved their office to 1716 Cherry street, Philadelphia.

* * *

Benjamin Howell Lackey announces that he has opened offices at 509 Federal street, Camden, N. J., for the practice of architecture.

* * *

The members of the Builders' Exchange were fortunate in having as their guest on May 6th the Honorable J. Hampton Moore, Mayor of Philadelphia. Mr. Moore has been a member of the Exchange for years and was indeed most welcome at the luncheon. He gave an interesting talk about the present City Administration and emphasized the fact that he is desirous of having the Exchange co-operate with the present Administration and do all possible to expedite building and overcome the shortage of houses in Philadelphia. The Entertainment Committee is to be congratulated on procuring the Mayor as speaker and the Exchange should congratulate Mr. Thomas Armstrong on his success in being able to have the Mayor talk to the members.

* * *

When you receive this copy of the "Guide" close your desk and proceed at once to the Builders' Exchange so that you will be in time for the Annual Outing and Shad Dinner, which will be held Thursday, the 13th, at Mineral Springs Hotel, Willow Grove. The members of the Exchange will leave the Exchange Building at 1 o'clock and proceed in automobiles to Willow Grove. There will be ample room for everybody. Come out for a good time.

THE EVOLUTION OF BRICK.

One cannot study the history of the clayworking industry in this country without being impressed with the wonderful evolution that has taken place in connection with brick. In the pioneer days brick was brick, and the products in clay were in the main brick and tile. Today we have a wide range of products developing from the brick idea and a wonderful change in the brick product itself.

At first it was just brick; then came the distinction between what might be termed common brick and refractory brick, those having peculiar fire-resisting qualities. Later came the vitrified paving brick for sidewalks, streets and roads as an improved item for this purpose over the common, ordinary brick. Still later came the development of front and fancy brick, and out of this has grown up our great face brick industry.

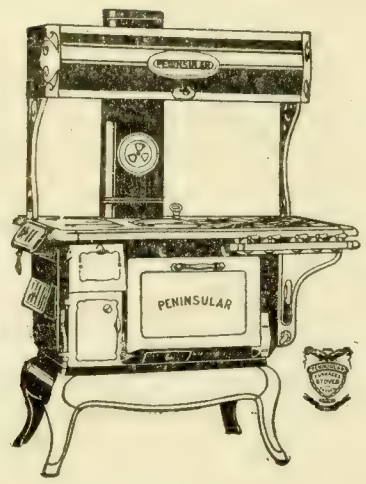
Incidentally, an offshoot from the brickmaking is hollow tile, which was used primarily for inner walls and for fireproofing purposes around steel structure members, but which is now spreading out into the broad field of general wall construction.

The vitrified or street surfacing brick, plus the face and ornamental brick, plus the hollow building tile, make up an item the total of which today equals the total common brick production. Yet, when we go back and think it over, this all but a matter of evolution or development from common brick.

What is perhaps more directly interesting right now, however, is the process of evolution in common building brick during the present generation. Common brick making has undergone some wonderful changes from thirty or forty years ago. Practically everything made then would today be termed common brick, and quite a percentage of kiln turnout was soft burned and called salmon brick. Today we have reports of kiln burns ranging up to 95 and 98 per cent. perfect. This means there are practically no under-burned brick, and that in quality the poorest of the common brick today is superior to the best face brick used forty years ago.

Naturally under these conditions we have not only developed a great line of special face brick, but we have developed brickmaking to the point where it is a question if we can properly call any great percentage of our brick common brick in the light of what common brick was understood to mean a generation ago.

Sometimes we think there is no such thing as common brick any more, except a few scattered plants where modern ideas have not yet been applied to brick making and burning. In the majority of modern brick making institutions the common brick product has been so improved in the process of making and so much better burned that it is now a superior article.



One going back through the history the past forty years in clayworking in this country is impressed with two things. One is that there has been a wonderful evolution in brick making, in which the common brick has become a number of items of uncommon quality. The other is that America today produces the best as well as the greatest line of clay products to be found anywyhere in the world. —*The Clay Worker.*

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

As The Editor Sees It

IN view of the very grave aspect of the housing situation throughout the country the work of the Committee on Community Planning of the American Institute of Architects is of particular interest at the present time.

John Irwin Bright, of Philadelphia, is chairman of the committee, which is composed of representative architects from all sections of the country. Mr. Bright's report of the Committee on Community Planning to the Fifty-third Annual Convention of the American Institute of Architects emphasizes the scope and importance of the work of this committee and prepares the way for the more detailed activities of this committee. Mr. Bright's report reads as follows:

The Committee on Community Planning begs leave to submit the following report:

The mandate of the Institute is specific on two points: First, to report on the housing policy of the United States Government during the war; second, to analyze the Canadian effort to supply houses.

The United States Government housing has shown us the difference between houses and communities built for service and those built for private profit; also the difference between a group plan developed by unrelated individual effort and one conceived in the interest of the entire community.

An intelligent direction is necessary in any housing enterprise. In the case of the Government, it produced houses whose main characteristics are quality, usefulness, and beauty. If the same degree of intelligent direction had been exercised by speculative interests it would have resulted in a subordination of all desirable features to the necessity of earning a profit on the investment. It is significant that we speak of the "necessity" of a profit and the "desirability" of good living conditions, because that state of mind is responsible for the indifference with which we view the disappearance, one by one, of all the desirable features of the home. When all is lost but private profit, we refuse to build, for that is the one thing which we cannot bring ourselves to surrender.

The government, however, was able to do this, but the elimination of gain was, after all a negative virtue and taken alone teaches but half the story. The positive virtue is the development of the community plan in which the welfare of all was considered before the supposed rights of any one individual. Housing produced by private enterprise, working primarily for a profit, cannot regard the social advantages of its customers as of equal value to the financial return on capital and it is therefore plain that if people wish to live under such admirable conditions as exist in most of these villages, the speculative builder must be barred out.

The physical arrangement of the houses is a distinct advance over the usual prewar type. This was only to be expected, as never before was the national effort so concentrated on this prbolem, enlisting the best minds of the country in the effort to design and erect pleasing houses. Generally speaking, the houses were but two rooms deep ,and when the detached house was not possible, the rows were short and architecturally pleasing. It is to be hoped that these object lessons will exercise a stimulating influence on our future domestic architecture.

Unfortunately, these efforts have taught us nothing on the questions of land, finance, and management for the very good reason that the face of the government has been set against any study of these questions. As far as can now be seen, the houses will be sold to individuals and the values created by the community itself will ultimately revert to the individual or the speculator.

The Candian Scheme

In order to make it possible to build houses in Canada, its government has established a credit of $25,000,000 to be advanced to the different provinces. The entire fund has been distributed and will be used within one year, Ontario ,on account of its greater population, receiving the largest proportion. The provinces lend to municipalities, which in turn lend to limited dividend housing companies or to individuals ,the amount of the advance

BLUE PRINTS

and the security varying with the circumstances. Each borrower in turn pays 5 per cent. for the money and there is no overhead charge except in the actual designing and construction of the house. The loan runs from twenty to thirty years and is repaid in monthly installments. In addition to these enactments, all of the provinces appropriated funds of their own for housing, although the credits are smaller than those furnished by the Canadian Government.

With the exception of the Province of Quebec, where an effort is being made to introduce the community-owned town, the theory of individual ownership and sale govern this experiment. The price of the house and the land is mentioned in the laws, but since the date of its promulgation, rising construction costs have made it necessary to somewhat lower the standards. It remains to be seen what will happen when, in the future, a dollar will buy more building that it does to-day, for the price of the land will then become a factor. While the land may be expropriated, it must be paid for at its market value and there is nothing in the law to prevent its mounting to a level which will again stifle production. This is a situation which has wrecked many housing schemes in the past. s

In furnishing state aid to the prospective house builders the Government has tried to avoid entering into competition with private operators. In return for its lower rate of interest, it demands a certain standard of construction and design which is calculated to absorb any saving made in the use of Government money.

The active work of the committee during the last year has been confined chiefly to two things. First, the publishing of a report on the platting of areas for dwelling use, and second, the organizing of a lecture tour on housing illustrated by moving pictures.

The committee has received and answered a great number of questions on community planning coming from cities and Chambers of Commerce. The result of this work has been negative as without exception the questioners have acted as though under the impression that a community plan was a physical commodity mailable upon request. The efforts of the chairman and other members of the committee to present the question in a different light has in no case succeeded.

The general tenor of these requests seems to demonstrate that there is as yet no general public realization of the issues at stake. This can only be corrected by a campaign of education, and in order to make a commencement on this line, the lecture tour has been undertaken. The committee hopes that the Institute will appropriate a sufficient sum of money for its continuance The committee recommends that in presenting to the public the idea of community planning, a certain definite theory should be expounded. It is not enough to show pictures of charming houses. It should be taught that to obtain the result, certain changes conneced with our ideas on finance and social rights must be effected. Not until industry is organized to produce socially useful goods can there be a real answer to the building problem, but without expressing itself on this question the Institute could perform a great public service in concentrating attention on immediate evils. The public expects its architects to advise it rightly on problems connected with plan and building, and while rendering this service, we should fit ourselves to discuss the whole question. In this category, the protection of the value created by the community itself should receive the first consideration. This has been called inaccurately the unearned increment and the faulty definition has largely been the reason why its significance has not been generally comprehended. Increment is not unearned. It is earned, but, to use a bookkeeping expression, we have not credited the asset to the proper account. The neglect to balance it against its creative forces has permitted the impression that it is spontaneous in its origin and its rape is the right of the discoverer. It is the same logic which allows otherwise honest people to appropriate, without a qualm of conscience, the personal belongings forgotten in public conveyances.

We should make it clear that all of the value created by the commuity should revert to it. On the other hand, it is no less fitting that the prior right of the individual to the values he created should receive recognition. The fair adustment of these claims, conflicting at times, is a matter of judgment and not of principle, and ,equitably arrived at, will go far toward the solution of the land question. The Institute should urge that laws on taxation should be so formed that land speculation be eliminated. In this connection it should be pointed out that the general progress of recent town planning acts, in this and foreign countries, is along these lines.

The committee recommends that the doctrines be disseminated by means of the Journal, the public press and by pamphlets in addition to the lecture tour already under way.

The committee urges its successor to undertake the compilation and critique of town planning and zoning laws throughout the world in order that the usefulness and the trend of these ideas may be presented to the public in a concise form.

The committee does not consider its report conclusive. It will be content if the event shows that it has supplied to its successor a working instrument for future achievement.

The committee wishes to acknowledge the invaluable assistance which has been given it by the Editor of the Journal. Its work would have been rendered vastly more difficult without his sympathy and advice.

NO WOODEN HOUSES IN GREAT BRITAIN.

A while back there was quite a lot of newspaper talk about Great Britain turning to wood as a means for solving the housing problem in shorter time and at lower cost than if the usual method was followed of building with brick for permanency. Now there comes a report which indicates that this was mere talk, and that the people of the old country do not take kindly to flimsy or temporary building.

A recent consular report from England says that not much personal interest has been aroused in the subject of wooden building but there is being aroused interest in the modern type of American dwelling. It is pointed out in this report that the cost of building homes of the ordinary English style is now more than double what it was before the war and there is no likelihood of these prices coming down in the near future. In support of the claim for increased building cost a tabulation of current building material prices is given in which the best brick is now listed as $19.83 a thousand as compared to $8.88 just before the war.

There is incidental mention that the Leeds Corporation has decided to erect concrete houses, and there are various lines of relief suggested, but from a study of the reports, one is moved to the conclusion that the great era of wooden building prophesied for England will not materialize. What is more likely to happen is that the English builders will take on some of the modern ideas in American home architecture, modify them to suit their own notions and needs and build in the main with brick and other hard material because even with the present advantage in price these are lower and cheaper in the long run than lumber at current prices.

J. H. Squires, Director of Personnel, Dupont Company, Wilmington, Del., will speak to the members of the Philadelphia Builders' Exchange, Thursday, May 27th, at the luncheon at 1.30 at the Bellevue-Stratford.

Mr. Squires is particularly qualified to talk on human nature, as he has had charge of employing most of the men taken into the Dupont Works.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

SHEETROCK
WALL BOARD

SHEETROCK is not only cheaper than lath and plaster, but saves time and labor. It's made of pure gypsum rock, can be papered or painted as well as plaster, is stronger than wood, and won't burn, warp or shrink.

This scientific, fireproof wall board fills any plastering need. Instead of having to nail on lath and then troweling, and waiting for your scratch coat to dry, and your finishing coats to dry, you can nail Sheetrock to walls or ceilings and they are ready for paint, paper or panels.

Ask for a sample and you'll see for yourself why the Government has used over 5,000,000 feet of Sheetrock.

Greatly Outlives Wood Wall Boards and Costs About the Same

WHEELBARROWS AND DRAG SCRAPERS

Results and Tangible Dollars and Cents Saving Combined

It accomplishes both, therefore, you can specify it with this assurance. *Experience proves both.* Everywhere it is used—on all inside surfaces—it gives a first-class, hard finish that stands the test of time. It is economical not only to *use*, but in actual *low cost*, as compared with other paints. *It goes twice as far.* Is does not peel nor rub off. White and colors.
By the bbl., 10c lb (40c gallon); smaller lots, 12c lb. (48c gallon). Special price to contractors. *Liberal testing sample free to prospective big users.*

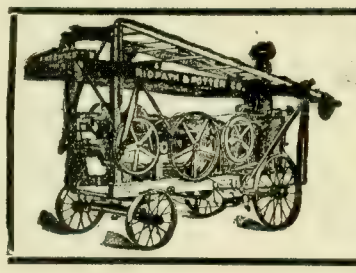
An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

"Camouflage" doesn't pay in advertising. Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.



Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

STORMTIGHT

Will Save Your Old Roof For Ten More Years of Stormproof Service

Here is a weatherproof, fire resisting compound adapted to use on roofing of any description. It is the only material that will successfully repair gravel, slag and corrugated iron roofs. Wherever wear, rust or corrosion have caused cracks and leaks to appear, Stormtight will effectively and permanently seal them up. Used as a complete covering, it makes a permanent, one piece job without seams or laps, at a very low cost. Heat, rain, storm or cold does not affect it. Stormtight comes in two forms plastic or liquid, and requires no skill to apply. Sold under a definite guarantee. There is no such thing as risk for you. Full particulars are yours for the asking.

GUARANTEE

STORMTIGHT applied in accordance with our instructions is guaranteed to give absolute satisfaction and to protect a roof from leakage and keep it watertight for a period of ten (10) years.

We will replace free of charge any quantity of STORMTIGHT which after having been applied in accordance with said instructions proves defective.

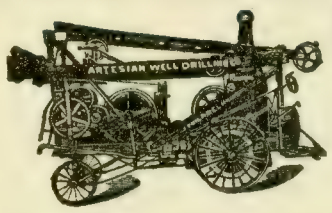
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

Storehouse, Pigeon Loft and Hangar, Spec. 4085, Anacostia, D. C. Architect, private plans. Owners, U. S. Government, Bureau of Yards and Docks, Washington, D. C. Wood, frame and corrugated iron, corrugated iron roof, concrete floors, concrete foundations, steam heat, electric light, rolled steel sash. Owners taking bids. Plans may be secured from Bureau of Yards and Docks, upon deposit of $10.00.

Residence and Garage, Belmont street and Crescent Place, Washington, D. C. Architect, John Russel Pope, 527 Fifth avenue, New York City. Owner, Irwin Loughlin, Washington, D. C. Brick, hollow tile, terra cotta and steel, 3 and 2 stories, 78x80 feet, 36x40 feet, wing 24x18 feet and 29x18 feet, composition, slate and asphalt roof, composition, pine, parquetry and cement floors, metal lath, elevators, roof ventilators, waterproofing, concrete foundations, steam heating, electric lighting, tile and marble work, copper skylights, iron stairs, iron work. Architect taking bids. Irwin & Leighton, 126 North Twelfth street, Philadelphia, are figuring.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 14, 1920. Sealed proposals will be opened in this office at 3 P. M., June 11, 1920, for remodeling the main building of the United States Marine Hospital at Boston, Mass. Drawings and specifications may be obtained from the superintendent of construction, Room 437, Post Office Building, Boston, Mass., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 3, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 1, 1920, for the mechanical equipment of the laundry building for the United States Marine Hospital at New York, N. Y. (Stapleton), in accordance with drawings and specifications, copies of which may be obtained from the Supervising Chief Engineer, Room No. 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 3, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 1, 1920, for furnishing the labor required in the construction, complete (except mechanical equipment), with materials that will be furnished by the Government, of a laundry building for the United States marine hospital at New York, N. Y. (Stapleton). Drawings and specifications may be obtained from the Supervising Chief Engineer, Room 731, United States Custom House, New York, N. Y., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

PICATINNY ARSENAL, Dover, N. J.—Proposals for extension and alteration to Power House at this Arsenal will be received until two o'clock P. M., June 1, 1920. Apply to Commanding Officer.

R. S. Whiting, Architectural Engineer, Architectural and Building Code Service, National Lumber M'f'g's Association, says, "The ordinary residence as built today (and held accountable for so great a part of the country's fire loss) is a type responsible for the least fire loss in dollars of any type of construction now built.

My statement, continues Mr. Whitney, is very plainly illustrated by the following figures, which represent the total fire losses for the last quarter of last year and show the percentages of loss in buildings and contents in each of these various types:

	%	
Warehouses, factories	41.6	$29,707,000
Business sections	12.	8,972,000
Oil refineries, mills, tanks	10.3	7,275,000
Tornado	8.6	6,000,000
Saw Mills, Yards, mill work	7.2	5,135,000
Grain elevators, crops	3.5	2,786,000
Dwellings	**3.5**	**2,776,000**
Wharves, coal sheds, bridges, boats	3.4	2,665,000
Hotels	3.2	2,165,000
Stables, barns	1.8	1,227,000
Garages	1.6	922,000
Theaters, schools, churches	1.4	662,000
Timberland, forests ..	.8	530,000
Government property.	.1	75,000
	100	$70,897,000

The report shows that dwellings comprise a surprisingly small percentage, especially in view of the fact the lumbermen are freiquently confronted with forceful statements by insurance men that wooden dwellings and shingle roofs are the greatest menace to life and property. It also is apparent from the report that more than half the total loss has been sustained in congested and mercantile districts, which are largely left during the night without sufficient wathchmen or fire alarm service.

No fair comparison can be made by the fire losses of European countries with the fire losses of the United States, since in many, if not all, European countries, an "Individual Liability Law" is in effect which makes each individual property owner personally responsible for losses caused by the spread of this fire to other adjoining property.

The psychology of an individual liability or personal liability ordinance is evident since it touches the pocket-book of each property owner and naturally greatly reduces the start of fires either by accident or otherwise, making individuals more careful and naturally reducing carelessness, which is really the cause of from 75 to 90 per cent. of our fires today. If you will take the pains to investigate this matter, you will find that this statement is true, and that today in many of the cities of the United States are now in force ordinances affecting the personal liability for fires.

In Portland, Oregon, such an ordinance is in effect, and at the present time a test case is being tried in the courts there, and in Billings, Montana, a similar ordinance is in effect, which makes the property owner personally liable for the time the fire department spends in extinguishing the fire upon his premises.

The greater percentage of fire loss is in commercial buildings in the congested districts, and it is toward these sections of cities that a greater effort should be made in the fire-prevention measures and not to the uncongested districts where so few fires occur.

A properly coinstructed frame building in which simple methods of fire stopping are applied will not permit the rapid spread of fire from one room to another, and a fire once started in the interior of such a building can be more easily extinguished than in buildings which are constructed with incombustible walls. You are probably aware that a very small proportion of fires are caused from external exposures and a larger proportion or the largest proportion are of interior origin, which bears out the argument very strongly that carelessness is the main factor in the cause of the fires and not the construction.

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.

TO PREVENT ACCIDENTS IN THE BUILDING TRADES

It has been estimated that even including minor injuries which were frequently not reported, the total injuries during the recent war to the members of the military forces as a result of both accidental causes and battle casualties did not exceed half a million.

In a single State in the year 1918 there were nearly 200,000 accidents among industrial workers alone. If a tabulation of all States could be made on the same basis the totals would greatly surpass the battle casualties of the American Forces during the war.

According to the Bulletin of the Pennsylvania Department of Labor and Industry, more than $600,000 in wages was lost in the building and contracting trades in 1918. The following table was taken from the report:

	All Industries	Building and Contracting
All Accidents ...	184,844	9,190
Fatal	3,403	221
Serious	53,783	3,069
Minor	127,658	5,900
Due to lack of Safeguards ...	10,512	580
Days lost	2,767,471	147,357
Wages lost .....$	10,286,872	$601,136

It will be seen that 580 out of 9,120 accidents were due to lack of safeguards. This is about 6 per cent., and high in comparison to other trades, since in mines and quarries the rate was only one-half of one per cent. Yet it is a small percentage of the whole. And while mechanical safeguards might do something toward reducing the figures, it is obvious that if they can be reduced materially, the problem must be gone at from another angle.

This angle is First Aid instruction such as the American Red Cross is offering to any group or club of workmen anywhere who care to take it. The experience of the Red Cross has conclusively demonstrated that the accident rate among men who have had efficient instruction in First Aid is 75 per cent. less than among the uninstructed. The course has been introduced among hundreds of thousands of workmen in many industries during the past few years, and has proved thoroughly satisfactory in every case.

I make it a rule never to write a grouchy letter—I telephone.

DIGGING A POOL WITH DYNAMITE.

By Norman Supplee.

On a large estate in the suburbs of Philadelphia, the owner desired to have a swimming-pool dug and constructed, dimensions being 32 x 25 and 7 feet deep. This swimming-pool was to be filled and fed by a stream which would run to the pool. It was necessary, therefore, to provide means to take care of the water during the process of the excavation. This was done by turning the stream to the far side of the pool, giving a space for the excavation of the pool, a space of about four feet which the stream occupied.

I put on five men to excavate the dirt. The ground being quite full of water and the general locality abounding in springs gave considerable difficulty in getting the dirt out expeditiously. As I am an experienced agriculturist I decided to use dynamite if it would possibly serve the purpose, the only drawbacks being that the swimming-pool was built at the corner of the property and two estates being on the other sides of the property's rail fences. On one end was a big garden fairly well grown and on the other was a very beautiful lawn. Of course, we would not do any damage to either property. I began experimenting and placed one shot of a half of stick of agricultural dynamite down to a depth of about two feet, six inches. When this went off we had quite a fair hole. I then decided to try a stick instead of a half of a stick. This I placed in to the depth of only eighteen inches. This threw out a sizeable hole, but it scattered the dirt on the adjoining property. The next step taken was to place the charges at an angle. The opening being toward the adjoining property, the thought being that this would cause the throwing of the dirt more in the direction of the client's property rather than in the neighbor's. The results were fairly good, but still some dirt went on the neighbor's property.

The next shot was put in the same way, but we constructed a heavy platform, which after the fuse was lighted we laid over the place where the charge was to go off, right down on the ground, the idea being that the shot set at an angle, this platform being on the opposite side would further aid in causing the dirt to be thrown away from the neighbor's property. The result in this case was not quite as anticipated, the heavy platform having the effect of keeping the blasted material down into the ground. Therefore, the next shot was placed in a similar manner but with the platform raised on one side at an angle above the ground with the platform between the neighbor's property and the shot, the thought being that the dirt would fly up and strike this heavy platform and would be deflected from the neighbors' property, and yet not have the effect of keeping the shot down. The results were just what we anticipated.

The report of the excavation up to this point was that it took one hour to make all these various shots. The five men had been on the work of excavation just one hour, and in that time had thrown out five cubic yards of earth, and as the men were receiving thirty cents an hour, it would cost about $1.50 for the five yards. Two men assisted in placing the platform. The blaster had thrown out about eight yards of dirt by the use of five and a half sticks of dynamite. In figuring up the cost it was estimated that fifteen cents a yard had been saved in the excavation or seventy-five cents on one hour's work.

The pool was proceeded with in the same manner, a series of shots being fired, moving back about three feet for each series. The result derived was that they were clean excavations down to a depth of three feet. The men were then put in to clean out the loose soil an additional foot and a half. The blaster had taken just one day and had used up about one hundred pounds of dynamite. In estimating on the work, I had estimated on twenty days for five men; that would have been $200. The dynamite cost $50, the men and their assistants amounted to $5, with $1.50 for the making of the platform, brought up the total to $6.50. This added to the $50, made $56.50. It took about two days for the five men to clean out the loose dirt, which makes the entire job run a little over $100.

It was one of the best proofs of dynamite as a "Pinch-Hitter" and a tremendous convincer that it is exceedingly tractable if properly used.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

Repitition tends to create **habit**, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

Vitrified Paving Bricks

Standard specification pavers at lowest market price.

Sole Representative of Mack & Pennsylvania Clay Works

As The Editor Sees It

THE situation in the country today, which was precipitated by the general reductions in merchandise started here and now spreading throughout the country, is one of uncertainty and uneasiness. Money is tight; the banks are calling in loans and refusing to make new ones, and a number of people have predicted a panic.

Looking at the matter sanely and calmly, however, we fail to see any real cause for alarm.

The National City Bank of New York holds that trade conditions are sound and says:

"There is no evidence that stocks of goods are excessive in this country. Reports commonly are that dealers have difficulty in getting goods fast enough to take care of their trade. It is true that the pressure for credit indicates that inventories are high, but this seems to refer to raw materials rather than to goods ready for the consumer's market, and this condition results largely from the delays and uncertainties of transportation. Manufacturers find it necessary to carry larger stocks to be sure of having enough to keep their establishments running in all departments. Large stocks at the present level of prices are undoubtedly an element of danger, but the manufacturing industries of the country are generally in a stronger position as regards the relation of assets to liabilities than they have been in the past.

"Conditions the world over are not such as to suggest a state of over-production in any essential industry in the near future. *The conspicuous feature of the situation is the great backed-up demand for construction work, and there is no record of panic and industrial depression in the face of such a prospect. The needs for housing, for railroad equipment and for construction work of many kinds in our own country, not to speak of the needs of other countries, are imperative.*"

* * *

Another organ, *The National Builder,* reminds us that "the demand for building is an essential demand and must inevitably surmount all the difficulties that tend to hinder."

One of the greatest difficulties to be met by the construction industry at present is the instability of labor conditions. "Not long ago," says *Building Industry,* "bricklayers were examples of laborers willing to lay more bricks for more money, and were enabled to do so with less exertion by studies in various efficiency methods. Now they are killing their trade. A lessened efficiency, to a really alarming extent, is noticeable in almost every branch of the building trades. In some instances it is estimatetd that the increased wage and decreased efficiency has quadrupled the cost of labor within the past two or three years. Employers cannot pay the wages demanded together with the exceptionally heavy increase in the cost of materials.

"One thing that should be borne in mind and which is usually not thought of is that millionaires have no monopoly of wanting shelter. Wage earners are the greatest sufferers and complainers against the rent profiteer. Thus, as in many other cases, labor is damaging itself.

"It is a short-sighted as well as a treacherous policy, to make demands contrary to agreements, and even to agreements which have been revised favorably to the men. Contracts cannot be made when bidders cannot reckon their labor costs, and the demand for building labor falls off before the demand for buildings is satisfied. There had been no indication that the demand for buildings would be satisfied for several years, so great was the shortage created by the war stoppage of construction. Conditions never seemed brighter for business until labor began 'snowballing.' If the unions are prudent they will realize there is a limit to all things, and that steady wages for a long time are better than trying to get extortionate wages for a short period."

ANOTHER great problem before the coinstruction interests today is how to finance the building of homes. From Chicago comes news of a scheme—"the installment mortgage."

Its inauguration is due to the efforts of

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

some of the large industrial concerns in Chicago and other cities to promote the interests of their employes. The shortage of homes adds not only to the financial burdens of many classes of people, but has a general disturbing effect that fosters unrest and a decrease in production.

In one of the plans involved the employes are to make an initial payment of 10% of the cost of the home and then pledge themselves to pay the balance in monthly installments covering a period of ten years, the total cost being just what the cost has been to the corporation. It is believed that such plans can not fail to have a helpful effect on general industrial conditions, for nothing has a more stabilizing influence on those who perform the country's work than adequate and comfortable homes.

During the first four months of the present year more than one-half of the total valuation of new construction work has been for industrial and business buildings. While there is great need for these, there is a vital necessity that a larger percentage of the nation's building activities should be directed to the construction of homes. Only about 20% of the total construction of the country so far in 1920 has been given to home building, which is at least 10% below normal.

MAKING CAVITIES IN CONCRETE WITH ICE

Up to the present it has been possible to make only small cavities in concrete, but under a new German patent a big advance appears to have been brought about. Pieces of ice, corresponding to the measurements of the cavity required, are imbedded in the concrete mass, and small channels are introduced to allow of the rapid removal of the water after melting, says the Scientific American.

In this way not only can small concrete constructions, such as pillars, beams and stairs be supplied with a hollow space, but large fixed blocks can be made with several chambers, such as are required for walls of houses or ships. The process is of particular advantage in reinforcing concrete with iron. The iron parts are not built in during the stamping, but are attached to the ice blocks before the beginning of the work, which increases its strength.

The continuing moistening usual in concrete work is rendered unnecessary by the new process, as the loss by evaporation is made good from the melted ice.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

BETTER SCHOOL BUILDINGS RECOMMENDED BY U. S. BUREAU

Consolidation of rural districts and the erection of large modern school buildings is the recommendation which the U. S. Bureau of Education offers, not only for the present and prospective shortage of teachers in the public schools, but also as a means of extending free education to sections in which it is now wholly lacking or very inferior.

Already several States have adopted this plan of merging school districts and combining their respective funds into one from which to finance the establishment of new schools and the payment of salaries. Expenditures for these purposes in Indiana, Ohio, Minnesota, Iowa, Colorado, Utah, Louisiana and North Carolina have already totalled several hundred thousand dollars.

A. O. Neal, of the Bureau of Education, in a statement to your correspondent, said that the Bureau is urging the States to resort to consolidation and that the present shortage of teachers is stimulating the authorities of the several commonwealths to such action. He said that the signs point to a general adoption of the scheme, involving a very large outlay for new buildings in the next few years.

As thus far operated the consolidation of districts has resulted in a great betterment in educational facilities in many counties where schools languished. There has been an improvement in the character of buildings, since the volume of taxes was significantly increased by the merger, a growth in attendance, a readier response on the part of teachers and officials and a general uplift of educational standards. In one county in Iowa where four districts were consolidated a fine building has been erected at a cost of $78,000, a high school has been established and bus lines are in operation to take the children to and from school, yet the tax rate has not been increased.

The plan, which has the approval of the Bureau of Education, contemplates a permament school building, completely equipped, with home for superintendent and one for teachers, a garage for busses and necessary outbuildings. It has been found that all these can be provided with the funds raised by taxation at the prevailing rate. The use of busses to convey the children from their homes to school and back promotes attendance by insuring the pupils against walking long distances in inclement weather.

"Erecting additional or larger school buildings when there is a shortage of nearly 60,000 teachers in rural schools would seem to be a doubtful procedure, but it has been found that teachers are willing enough to remain at their posts if they can be sure of adequate accommodations and fair play," said Mr. Neal. "In those communities where teachers' homes have been provided under the plan we recommend, instructors have not been wanting."—*American Contractor.*

WHEN TO HEAT WOOD BEFORE GLUING

Whether a hide glue joint will be strengthened or weakened by heating the wood before gluing depends on the size of the joint. It is assumed, of course, that the work is being done in a glue room that is warm and not draughty and that the wood itself is at room temperature. Under these conditions, if the joint to be made is of small area, heating the wood is unnecessary. In fact, it may be detrimental, for the warmth of the wood will keep the glue thin, and, when pressure is applied, too much glue may squeeze out, leaving a starved joint. It is very easy to apply too much pressure to a small area.

In making glue joints of large size (several inches each way), heating the wood before gluing is of distinct advantage. Many experiments at the Forest Products Laboratory, Madison, Wis., have proved that when the wood in large joint work is not heated the joints develop full strength only in spots. Weak spots and even joints are too frequently discovered.

Uniform high strength in joints of large size may be secured by heating the wood in a hot-box for 10 or 15 minutes at 120 to 130 degrees Fahrenheit just before gluing. The heat from the wood prevents the glue from chilling and keeps it liquid until pressure is applied.

It should be remembered that heating the wood retards the setting of the glue to some extent. In heavy woods, from which the heat escapes slowly, this retarding effect is more marked than in lighter woods. In all species glued cold at the laboratory the time under pressure required to develop full joint strength was less than 8 hours. When heated wood was used at least 10 hours were required to develop full joint strength in mahogany and more than 12 hours in red oak and maple.—*National Builder.*

The last weekly luncheon of the Philadelphia Builders' Exchange will be held at the Bellevue-Stratford on Thursday, May 27th, at the Roof Garden.

Mr. Thomas Armstrong, Chairman of the Entertainment Committee, has assured the members of the Exchange that there will be a very good talker present and he is withholding his name so as to give the members a surprise.

Everybody is exhorted to be present and make this a jolly occasion, as it will be the last luncheon until Fall.

SHEETROCK

The Contractor's Choice

FOR years you have been looking for this standard wall in unit form. You have wanted a unit material rigid, uniform and fire-resistive.

Here it is—Sheetrock.

A sheet of pure gypsum rock, Sheetrock won't warp, shrink or buckle. Sheetrock will not burn.

On all framework and in all moderate-priced construction, Sheetrock makes a job you can be proud of. It pleases the owner.

You can go over the work with him—point out how evenly the units of Sheetrock join in a flat surface—remind him it will not crack or warp or buckle or shrink—remind him it will resist fire—because it is a sheet of gypsum rock—Sheetrock.

And the longer he lives with it, the more that customer is going to value Sheetrock and respect your good judgement in using durable, good-looking, economical Sheetrock. Whenever he has any other building to do, he will naturally think of you first.

Look for chances to use Sheetrock on alteration and repair work. Sheetrock comes in broad, flat compact sections, 32 and 48 inch widths—ceiling high. It cuts, saws and nails like soft pine.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

We printed in GUIDE of May 19th a report of the Committee on Community Planning of the American Institute of Architects and received the following commendation:

COMMITTEE ON COMMUNITY PLANNING
of the
AMERICAN INSTITUTE OF ARCHITECTS
112 *South Sixteenth Street*
Philadelphia, Pa.

May 20, 1920.

Subject: Report of Committee.

Mr. Louis S. DeLone,
THE BUILDERS' GUIDE
Perry Building, Phila., Pa.

My dear Mr. DeLone:

I wish to thank you for publishing our report. You are the only publicist in Philadelphia who is willing to print facts and opinions regardless of time-honored and worn-out theories.

Very sincerely yours,
JOHN IRWIN BRIGHT,
Chairman.

REBUILT HOUSES ARE PROFITABLE

The immediate demand for moderate priced and yet modern apartments in the San Francisco bay district, particularly near the industrial centres has developed a new line of building operations that has proved successful and profitable—the remodeling of well constructed buildings of old type and transforming them into up-to-date apartments. There are quite a number of such buildings scattered through the older parts of San Francisco and Oakland, and it has proved profitable work for the owners to remodel these buildings to meet the demands of the day.

The owners of the buildings of this type have viewed with apprehension their constantly decreasing revenue with increasing depreciation, a condition recognized as due to the fact that tenants today do not merely seek, but demand, modern housing.

Steady increase in manufacturing and the general business growth of our cities is resulting in like increase of the worker and co-worker. There is an ever-growing call for two and three-room apartments by those who demand modern housing. Ordinarily it requires a considerable investment to erect an apartment house, and to the man prepared to invest only a few thousand dollars this is a seeming impossibility. A recent careful survey of a number of old residences and flats led us to believe that with a very nominal expenditure such buildings, nonproducing, could readily be converted into income property, netting a most satisfactory return.

As an instance of the actual result to be obtained is cited a building of obsolete type now producing good revenues. It originally embodied but one home normally renting for $35 a month. The condition of the building was such as to make it legitimate prey for the house wrecker. Remodeling involved a cost of only $6500, yet the owner today has a modern apartment building of six suites, each comprising two or three rooms, and all exceptionally well lighted and ventilated. The owner receives a rental of $200 per month or $2400 per annum. His gross return on the investment is 36 per cent. It is of interest to note that but ninety working days were required to effect the transformation.—*Architect and Engineer.*

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

CONCRETE HOUSING

BY IRVING K. POND, *Architect*

I have written so much abstractly on architecture and architectural principles that it is good again to get down to hard and fast matters and fix my hypotheses in the concrete. I say "again" for many years ago, as chairman of the Committee on the Allied Arts of the American Institute of Architects, I was the author of a widely circulated report from that committee dealing with concrete as a medium of architectural expression. I have had but slight occasion to put into practice the theories I then advanced, but I have continued to hold, and still maintain them.

Since that time the use of concrete in building operations has grown apace and enthusiasts and specialists have arisen to scatter their words and their works broadcast—sometimes, though not always, the words being more attractive than the works—sometimes the words and the works alike bordering on the grammatically atrocious—as for instance when the beauties of cast-rock faced concrete blocks have been urged and the monstrosities themselves have made pitiable what otherwise might have been semi - respectable structures — "semi," mind you, not "wholly" respectable; for the taste which could advocate, and incorporate into its product, such base imitations could not create or fashion a thoroughly respectable structure. Some two years ago while acting as chairman of a board to adjust and settle perchance, jurisdictional differences between the carpenters, the architectural iron workers and the sheet metal workers of Chicago, I suggested facetiously that the fabricators of imitations should be penalized by giving over to the trades whose products were imitated the erection of all such imitations. Thus stone masons should erect all tin fabrications simulating stone cornices, architraves or entablatures; and do plastering where plaster simulated Caenstone—one might put it "con"-stone—on walls and in vaulted ceilings. My pleasantry was met with hearty and strenuous disapprobation—each trade wanted to tell its own little lie and to reap the benefits which each felt certain would accrue to it in a world so lightly endowed with the elements of sincerity or of good taste.

So my first item of advice, if I may be permitted to offer advice to a body of men interested in the development of or handling a comparatively new and altogether worthy building material, is to treat the product with respect, to shun and scorn imitations, to recognize limita-

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

tions, which attach to all materials, as well as to all men, and to work within those limitations. This is not saying that because a thing has been done, frequently and appropriately done, in one material it shall not be done in another or a new material which may be employed with equal propriety.

What these characteristic forms may be is a subject for very searching study and analysis. Possibly through synthesis rather than analysis will the characteristic forms disclose themselves. So it was in the past with the old materials—so probably will it be with the new.

Now concrete is a material which lends itself to many kinds of manipulation. It can be cast, poured, pressed, assembled in the shop or on the job; it can be applied in liquid or in solid form to the work immediately in hand. So many are the possible methods of its application—such a diversity of means may be employed toward its legitimate ends, that some of its enthusiastic sponsors see in it a panacea for strucural ills and possibly for aesthetic building ills, a substitute for all previously employed materials—excepting, possibly, door hinges—and a perfect end in itself.

It behooves those who can impartially survey the entire field to offer both warning and encouragement—encouragement in its legitimate use, warning against its too free employment ,especially where other materials may better serve the conditions. The economics of the general situation favor concrete and through this factor alone there may arise a tendency toward its too general employment; toward its substitution for other materials which, though perhaps costing more in mere money, satisfy the senses and better fulfill geographic and climatic conditions. The cheapness and ease of casting a flat slab of concrete has led certain enthusiasts to advocate the general adoption of a flat slab type of roof in any and all parts of the country (and ultimately of the world). It is advocated for a northern climate because it can very cheaply be made strong enough to hold a load of snow and ice. But that is not what a roof is for—it is to shed snow and ice. The flat slab roof is advocated for a southern climate because the overhang or shade is so cheaply procured. The shade is desired, but not at the expense of ugliness which results from unembellished overhangs—and concrete embellishments are expensive. The factors of ease and economy in manufacturing concrete slabs, whether to be applied vertically or horizontally, contribute to a "simplicity" which tends toward stupidity and to a barrenness which begets ugliness. Where the general form is stupid and ugly not much in the way of reclamation can be effected by proportioning of windows or application of superficial ornament. If the mass is interesting and appropriately conditioned, geographically and climatically, slight defects in details will not too seriously challenge the taste, but an ugly mass is fatal.

In spite of the fact that the learned ones will point out that concrete was a favorite building material with the ancient Romans, and that traces of it are found attaching to Greece, Egypt and the ancient Orient, concrete as employed by modern Americans is a new material, the science and art relating to which are not fully developed.

Much has been done to satisfy the conditions of its employment—much more remains to be done. The newness of an art, or the suspected newness of an art, is a sufficient cause for criticism or antagonism in the average American eye. We are the most conservative people as regards art and the Arts on the face of the earth. We will not accept materials and methods on their merits and attempt to develop their intrinsic qualities or worth. Art is about the only line along which we are conservative, however; that is, we conserve very little along material lines—and we do sling dead art about recklessly and embalm its forms in lasting and eternally reinforced concrete in which they appear more dead than heretofore conceivable. The fact that they are embalmed in a vital and vigorous material emphasizes the fact of death. There are those who claim that these dead forms are alive—but only to the dead do the dead live! Concrete is a vital material full of character—let us give it its vital forms.

Because concrete has for so long been poured into moulds or forms and because of the coarseness of its ingredients, one of which was stone which could go through a two-inch ring, the earlier designers, and I fear there were architects among them, being dependent upon precedent, and knowing not where else to look, fell upon the crude Spanish detail and broad masses of the early Spanish Missions as representative of what best might be embalmed in concrete. And so Spanish missions distorted into bungalows and cottages and palaces spread like a rash over the face of the country. As technical and mechanical difficulties were overcome and processes refined, the rash itched to take another form of disease and turned into a classic fever, with now and then a touch of Gothic "pains," noted particularly in the traceries on solids and in voids. The fever still burns, the pains still grip. Expensive forms are built up and destroyed to produce effects which already, *ad infinitum, ad nauseum,* have been better achieved in stone. However, this is not always to be.

The waste entailed in the destruction of specially constructed and expensive forms has become apparent to many concrete users and exploiters, and their efforts to prevent the consequent loss, especially in case of the smaller residences and the houses with which this conference is more particularly concerning itself, has introduced an element which may well call for restraint in its application. For the sake of economy forms are used and re-used in close proximity. When such forms are not perfect in themselves and in utmost good taste, monotony in repetition becomes deadly, and woe is it to him whom cruel fate has condemned to inhabit a unit in an environment so constituted. Life and joy and self-respect must be absent from the dweller amid such surroundings. Even where the forms are charming and singly in good taste, repetition robs them of individuality and unfits them for occupancy by anyone possessed of character and personality. Individuality of character and personality are absolutely necessary in the units which go to make up the mass of a civilized and self-respecting society.

Consequently another injunction, which I offer by way of advice, is to avoid wastage of forms—but even more to avoid the monotony which must follow the unrestrained employment of any "motif," ugly or charming. Introduce spice into life in the way of variety. The principle underlying this admonition is just as applicable to a mill town as it is to the most highly developed suburb. In point of fact little or no distinction should be drawn between the mill town and the "swell" suburb. It should exist possibly only in the size of units; it should not exist in the expression of good taste and mental and bodily comfort. Perhaps I am getting ahead of the age and of the present topic. I hope not.

In spite of the manifold and varied means, methods, processes, applications, manipulations—textures, surfaces and colors appertaining to the use and employment of concrete as a medium of architectural expression and embodiment, I am not certain that I should advise its sole and unlimited agency in housing the activities of any one neighborhood or community. Indeed I am quite certain that I should not so advise; and this not altogether on the ground of a needed var-

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

iety, but that there are other materials which transcend even concrete as a medium of certain desired expressions of the human spirit in the art of architecture. And I should desire to see no community curtailed of, or denied, the right and power to express the best that is in it in the materials best adapted to that expression. Thus marble, granite, iron, bronze, brick, slate, each one possesses inherent qualities or characteristics not translatable into concrete even through the agency of base and artificial imitation. In the matter of brick, for example, there is scale to the unit which relates the mass to human desire and experience in an intimacy possible with no other material, while in natural color and texture the range is boundless. But, even with all that, brick needs other materials in its neighborhood for contrast and variety, purple-green or slate, soft white of stucco, weathered grey of timbers, with carvings and turnings; and craftsmanship which cannot be imparted by a mould however exquisitely the surface be wrought by the modeler's hand.

I assume that as an architect I am expected to say that the only way to make concrete an accredited and acceptable building material, adapted to all human and aesthetic needs, is to have its essence filtered through the alembic of the architectural profession, or its representatives. If you wish me to say it, of course I will—with reservations.

Now the most stupid of anacronisms are perpetrated by so-called architects; (they really are untutored archaeologists, or rather grave robbers) and the most blatant of modernisms, cut off from all context of history, have emanated from, again, so-called architects, (they really are unlettered sentimentalists). But I will say that the possibilities of concrete as a medium of aesthetic expression in building may best be apprehended by a sincere architect, with knowledge of modern social conditions and tendencies, working in co-operation with those who know the material at first hand and who also are sincerely working to exploit nothing, but to develop the latent and inherent possibilities of a worthy material. Such architects exist, such material men exist. They should come together. It should be a function of such conferences as this to bring them together.

I must say one word here as to what should characterize the architect in whom the material man and the public may well place their confidence, being assured that his will be leadership—real leadership and not selfish and autocratic domination. That architect must not exploit any material or system, but must be able to recognize, and free to employ the most effective and appropriate under the individual conditions. He must sense the sociological, including social, the ethical and aesthetic tendencies of his time so as to aid his client in the expression of them, curbing wasteful, demoralizing, disintegrating tendencies, and aiding toward social unification; diagnosing present conditions and meeting the situation with skill and clarity of vision rather than in applying formulae learned by routine in the schools. The architect should think in advance of the public and see the goal and the way thereto more clearly. Pity the public which follows, and condemn the architect who pursues, the selfish and blind course.—*Architect and Engineer.*

FINISHING ATTIC ROOMS TO RELIEVE HOUSING CONDITIONS

Housing congestion is to acute that the finishing of attic rooms is receiving attention by Chicago building authorities, especially by Building Commissioner Bostrom. It is estimated that there are in Chicago about 180,000 attic rooms which can be finished and made livable, accommodating 200,000 lodgers. If these rooms are finished and made attractive at an average cost of $600 each and rented for an average of $10 per month, the gross return would represent 20 per cent. on the investment, the total investment being $108,000,000.

While housing laws do not permit the cooking or living quarters in the third story of frame buildings, in which most of these rooms would exist, they might permit of sleeping quarters and the rental would be very modest. The r ooms could be properly finished and insulated so that they may not be too hot in summer or too cold in winter and halfway measures in remodeling them will not be profitable in the long run. If adequately done, they will assist the permanent resident in meeting higher rent problems and will help relieve the present congestion. The question of finishing attic rooms may be profitably considered by other cities.—*Exchange.*

TAX EXEMPTION ON NEW DWELLINGS

Tax exemption on new houses during a limited period of years, as a means of encouraging construction in the present era of inadequate housing facilities and high costs, is a recent idea which appears to have many points in its favor. Whether there are constitutional barriers to such legislation has not been determined. Certain it is that men experienced in finance have advanced this as a solution of the housing problem, and it is receiving serious consideration in New York and in other States.

The elimination of taxes from new dwellings for a term of years would create at once a tremendous incentive for their construction. It might be advisable to extend the exemption to duplexes and to apartment buildings, throwing about the exemption safeguards to make sure that only buildings carefully planned to meet advanced requirements from the view points of space, lighting and sanitation can benefit by the exemption law. This would be particularly desirable for buildings erected in smaller towns, where the building codes are not exacting, or outside of the jurisdiction of the municipalities. It might be feasible to entirely exempt all detached dwellings and partially exempt apartment buildings.

For the moderate priced home with its site, the owner pays on the average in these years, not far from $200 annually in taxes. That applies to average homes in Northwestern cities, with the assessments based on pre-war construction costs of $5,000 or $6,000 for a dwelling. If new homes are to be assessed on the greatly increased cost of today, the increase in taxes will be very marked. Two hundred dollars is 6 per cent. interest on nearly $3,500—$3,333, to be exact. Removal of the tax on new houses for a period of five or six years would make the home building idea much more attractive to the prospective builder. It would appeal to him for several reasons. —*Architect and Engineer.*

Bricklayer—"Us workmen havent a chance—the contractor makes all the money."

Owner—"Why don't you go in for contracting?"

Bricklayer—Can't; wages are too high."—*Chicago Tribune.*

PASTE THIS ON YOUR DESK

Here is something for all professional men to paste on their desks:

"The artist or the professional man who sells his services for hire is precisely on the same plane as the mechanic who sells his services for hire, in that respect. The quality and value of his services may be different, but he cannot obtain the compensation to which the services are entitled by individual negotiations, except in rare instances; for the sale of service is no part of his professional training, but is a distinct business transaction having no bearing upon the service itself."—*Building Review, New Orleans.*

As The Editor Sees It

The GUIDE recognizes the Delaware River Bridge as one of the vital needs of this vicinity.

The close relation of this project to the interests of the Building Trades makes it of special importance to our subscribers.

We publish, on another page, a comprehensive plan showing the Bridge as the central link connecting traffic routes in both States.

Detailed plans of the Philadelphia and Camden approaches have been published in previous issues of the GUIDE. These with the accompanying articles, were prepared by E. Simpson Lemmon, Engineer, whose thirty or more years' active practical experience in designing and directing construction of important public and private work entitles him to consideration as an authority in such matters.

* * *

THE best possible conditions are none too good for an essential industry, such as the Construction Industry. Now, as never before, every effort is being made to serve—architect, engineer, builder, all are striving to build with a view to comfort, beauty and permanence. The best results cannot be obtained without satisfactory building codes.

"There is such a thing as proper building codes," says *The Clay-Worker,* "and it is about time for us to recognize this as a more important matter than promoting of class interest. The real interest to keep in mind in framing a proper building code is the interest of those who build and occupy buildings entirely apart from their specific business connections. This is the light to look at the matter from, and the clayworkers can well afford to look at it this way without emphasis or special coloring to make their producers appear in a stronger light. The products of other building material will eventually have to look at it this way, and the sooner all take a broader view and get together in the matter of proper building codes in the right spirit the better it will be for the building material business, as well as for the general public.

Mr. Frederick W. Lumis presented some interesting views on the subject of Building Codes at the recent National Conference on Concrete House Construction. Said Mr. Lumis:

In studying the art of house building, we discover that the most successful houses do not depend upon ornament, nor any particular kind of material, for their success, but rather upon good lines, simplicity and reasonableness. Any building worthy to be called a house should be built of enduring material, and with proper care should serve three or more generations. Whether the material is wood, or brick, or stone, or concrete—the thought of permanence should always be engrossing, if not paramount.

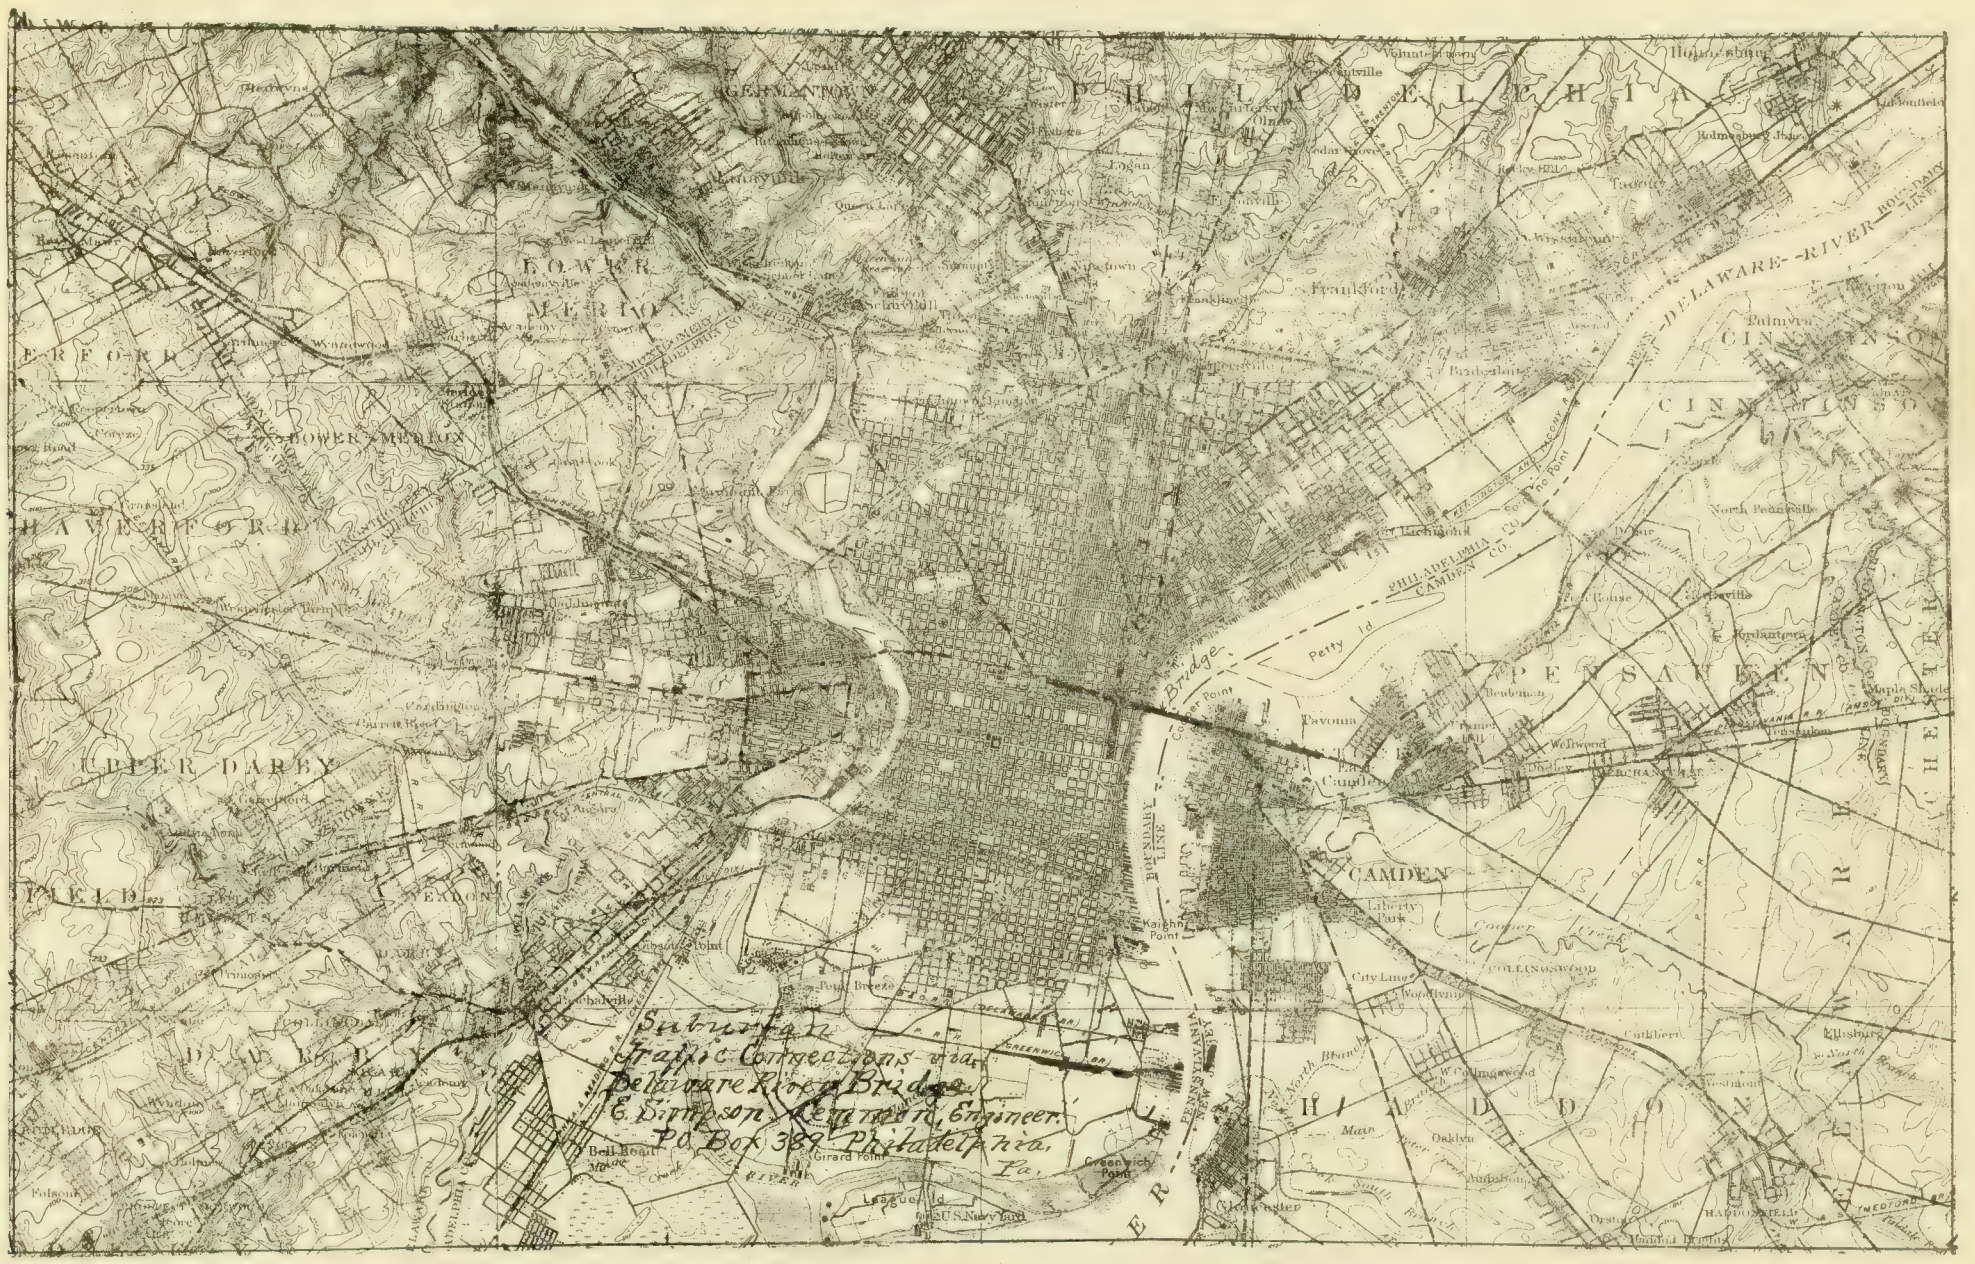
Much time and thought have been given to the study and examination of building materials. They all have their virtues, their limitations and defects. However, we will consider only the house built with concrete.

Before a house or other building can be erected in any of our cities, an application for a permit to build must be made, a plan must be filed, also a written statement describing the character, materials, use, and location of such building; all showing the purpose of the builder to comply with the requirements of the State and local building laws.

It will be interesting, therefore, to examine briefly the building laws or codes of some of our larger cities, so as to learn, if possible, their various regulations and restrictions as they apply to and effect the concrete house.

In considering the codes which I have mentioned, it will be observed that the requirements are general and not specific. Alike to the warehouse—a thousand feet long—and to the cottage—with partitions serving as diaphragms, extending in all directions, tying and bracing the whole structure, every few feet.

The vertical supports and walls in large structures are designed principally with respect to their compressive strength; but the designer of a concrete house is not permitted to utilize any such economies.



I have tried to condense typical, exist-

INTERSTATE AND SUBURBAN TRAFFIC CONNECTION VIA THE DELAWARE RIVER BRIDGE

E. SIMPSON LEMMON, *Engineer*

The Delaware River Bridge can serve the interests of the public only if located and built in accordance with certain well-defined requirements.

It must conveniently provide for national, interstate and local traffic.

It must avoid as far as possible adding to present congestion.

It must not necessitate ruthless destruction of valuable permanent improvements.

It must furnish by its accessibility opportunity for use by public utilities.

It must incidentally improve property adjacent to its location.

It must not be prohibitive in cost; and, most important of all, it must be practical from every standpoint.

When these requirements are considered, the location of the Bridge becomes automatically determined. Whether by the process of elimination or by the selective method the result remains the same.

The plan above shows the "Lemmon Comprehensive Bridge Location" in its relation to surrounding territory with the bridge in solid black lines, while the dotted lines indicate some of the many main arteries of travel that center at this natural location requiring but this one link to join them into a combination of highways serving one great community of common interests.

As may be readily seen, the location brings the Bridge into the center of Philadelphia, but just outside of the congested district, with easy access to the river front both north and south.

If built without disturbing any of the present street grades, it would come to the street level at Ninth and Buttonwood Streets, but during the past forty years there has been intermittent agitation demanding the elimination of the grade crossings along Willow Street.

If this work could be constructed in connection with the Bridge, then Fifth, Sixth, Marshall, Seventh, Franklin and Eighth Streets would become natural approaches to the Bridge.

The dotted lines show some of the many highways reaching a focus at Spring Garden Street on the Philadelphia side, while virtually all north and south streets are important arteries again branching out into suburban and **distant territory.**

The solid black lines show the Bridge in the center of the drawing.

The eastern end could furnish an outlet over Cooper's Creek via a high level bridge at State Street for all New Jersey points east and northeast of Central Camden, thus replacing the draw-bridge that otherwise would probably soon be replaced by another of the same type, such as now obstruct traffic in that direction, at all Cooper's Creek crossings.

The southern Camden approach, with its extended traffic lines, runs through the very center of Camden giving convenient access from all points of that city, while roads to outlying districts open like a fan from the Camden end of the Bridge.

Philadelphia's Standard Trolley Gauge differs slightly from the New Jersey Standard, so that special rails would be required on the Bridge and for the Terminal loops to accommodate both lines; but that is a very easy matter to care for.

The location offers easy connection for all the railway lines on both sides, and the community of interest plan works so well where both railways use the same tracks for many miles (for instance, south of Winslow Junction) that the same principle could apply here, as the

(Continued on Page 530.)

Barrett Specification type of Roof on Warehouse Pier No. 2 of the Norfolk & Western Railroad at Lambert's Point, Va.

No maintenance expense for 23 years—

IN 1892 the Norfolk & Western Railroad erected at Lambert's Point, Va., the warehouse piers shown here. A Barrett Specification type of roof was used to cover these buildings.

This was in the days before The Barrett Company issued Surety Bonds on Barrett Specification Roofs and before some of the present-day improved roofing methods had been worked out.

Notwithstanding this, *there was no maintenance expense of any kind on these roofs until* 1915. In other words, the owners were absolutely free from roof trouble and roof expense for 23 years.

When the time came to roof their new warehouse piers, there was no question in the minds of officials of the Norfolk & Western Railroad as to what roof they would use. They ordered the new buildings covered with Barrett Specification Roofs as a matter of course.

These roofs, shown in the illustrations below, cover an area of more than 400,000 square feet.

On them we have issued our 20-Year Surety Bond, and while the railroad officials were pleased to get the Surety Bond, they knew from experience that it was not necessary, for the roofs would outlive the guarantee.

THE SURETY BOND

The Surety Bond is offered on all Barrett Specification Roofs of fifty squares or more in all cities of 25,000 or over, *and in smaller places where our Inspection Service is available.* It is issued by the U. S. Fidelity & Guaranty Company of Baltimore, and exempts the owner from all maintenance expense for the life of the Bond.

Our only stipulations are that the Barrett Specification *revised April* 15,1920, shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

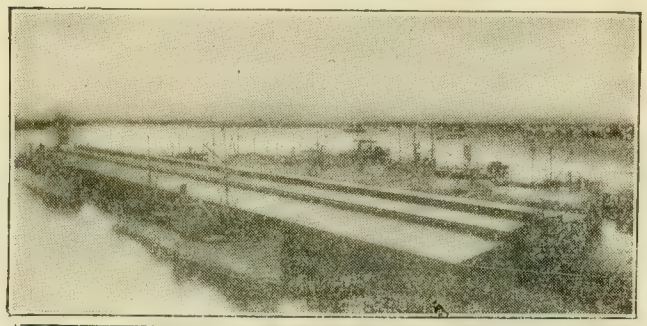
These roofs take the base rate of insurace and cost less per year of service than any other type of "permanent" roof.

Important Notice

The Barrett Specification 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can point to many roofs of this type that have been in service over forty years and are still in good condition.

For those who wish a somewhat lighter and lower priced roof covering, we recommend the Barrett Specification Type "A" Roof bonded for 10 years.

Both roofs are built of the same high-class waterproofing materials, the only difference being the amount used.



Full details regarding these Bonded Roofs and copies of The Barrett Specification sent free on request.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

4740 MARKET STREET - PHILADELPHIA-PA.
SLATE and TILE CARRIED IN STOCK
PRESTON 2630 WEST 751

Synagogue, Providence road, Scranton, Pa. Architect, L. Reisman, Miller Building, Scranton, Pa. Owner, Ahavath Scholen, 1731 North Main street, Scranton, Pa. Stucco, 1 story and balcony, 80x39 feet, concrete foundations, shingle roof, concrete and yellow pine floors, electric light, metal lath, sheet metal work. Owner will take bids.

Pennsylvania Contracts Awarded

Theatre Building, Windber, Somerset County, Pa., $100,000. Architect, Henry L. Reinhold, Jr., 1513 Walnut street, Philadelphia. Owners, Windber Theatre, Inc., Windber, Pa. Brick, 2 stories, 60x150 feet, slag roof, composition floors, stone foundations, steam heating, electric lighting, tile, marble and terrazzo work, ventilating system. Contract awarded to Windber Lumber Co., Ltd., Windber, Pa.

Foundry Building, Fernwood, Pa. Architect, Norman Hulme, 1524 Chestnut street, Philadelphia. Owner, Eastern Foundry & Machinery Co., Ambler, Pa. Brick and steel, 1 story, 60x120 feet, slag roof, cement floors, stone foundations, electric lighting, iron work. Contract awarded to Charles R. Davis & Son, 1500 Ellsworth street, Philadelphia.

School, Newport Township, Pa. Architect, R. M. Herr, Simon Long Building, Wilkes-Barre, Pa. Owner, School Board of Newport Township, Peter Sarpolins, Alden, Pa. Brick, 2 stories, 100x110 feet, stone foundations, slag roof, pine floors, steam heat, electric light, roof ventilators. Contract awarded to Nanticoke Const. Co., Nanticoke, Pa.

Factory, S. Washington st., Scranton, Pa. Architects, Ed. W. Davis & G. M. Lewis, Union National Bank Building, Scranton, Pa. Owner, Michael Bosak Co., 432 Lackawanna street, Scranton, Pa. Reinforced concrete, fireproof, 3 stories, 53x165 feet, slate roof, concrete floors, electric light, metal lath, elevators, roof ventilators, rolled steel sash, fire doors (plumbing, heating, electric reserved). Contract awarded to Beilman & Son, Scranton, Pa.

School, Sunbury, Pa., $90,000. Architect, Ralph Herr, Simon Long Building, Wilkes-Barre, Pa. Owner, Sunbury School Board, Mr. Strouh, Sunbury, Pa. Brick, fireproof, 2 stories, 105x65 feet, stone foundations, slag roof, maple floors, electric light, tile and marble work, hollow metal skylights, roof ventilators, metal weather strips. Contract awarded to Herman Milander, Wilkes-Barre, Pa.

Dairy Barn, Retreat, Pa. Architect, Austin Reilly, Bennett Building, Wilkes-Barre, Pa. Owner, Central Poor District, James Reilly, secretary, Wilkes-Barre, Pa. Tile, 1½ stories, 210x120 feet, concrete foundations, asbestos roof, concrete floors, hot water heat, electric light, stable equipment. Contract awarded to Nanticoke Const. Co., Nanticoke, Pa.

House, Riverside Drive, Wilkes-Barre, Pa. Architect, F. H. Atherton, Coal Exchange Building, Wilkes-Barre. Owner, J. C. Haddock, care of architect. Brick, stucco, shingle, 2 stories, 31x45 feet, stone foundations, slag roof, hardwood floors, hot air heat, electric light, tile work. Contract awarded to Shepherd Const. Co., Wilkes-Barre, Pa.

Chapel (alts.), Valley Forge, Pa. Architects, Zantzinger, Borie & Medary. Owner, Washington Memorial Chapel, Valley Forge, Pa. Contract for Bay B (Rhode Island) awarded to Horace H. Burrell, 206 South Quince street, Philadelphia.

Hotel (alts.) to Department Store, Shamokin, Pa. Architects, Ritcher-Lee Co., 32 South Seventeenth street, Philadelphia. Owners, Progressive Commercial Corp., 3032 Richmond street, Philadelphia. Brick, 3 stories, steam heat, electric light, tile and marble work, flush bulks, elevators, maple floors. Contract awarded to L. Cashmareck, 1769 Tioga street, Shamokin, Pa.

Club Buildings, Chester, Pa. Architect, Ralph E. White, Pennsylvania Building, Philadelphia. Owner, Aberfoyle Mfg. Co., Chester, Pa. Brick and stucco, 1½ stories, 91x200 feet and 100x42 feet, asphalt shingle roof, marbleloid and composition floors, stone foundations, waterproofing, iron work (heating, electric wrk and plumbing reserved). Contract awarded to John A. Hanna, Park Place, Chester, Pa.

Warehouse, North Bushkill Drive, Easton, Pa. Architect, J. M. Shnyder, Trust Building, Easton, Pa. Owner, Lehigh Valley Supply Co., Allentown, Pa. 1 story, 33x66 feet, slag roof, concrete floors, electric light. Contract awarded to Bechtel & Bechtel, Easton, Pa.

Residence (alts.) to Apartment, 6 North Third street, Easton, Pa. Architect, J. M. Shnyder, Trust Building, Easton, Pa. Owner, D. W. Reeder, 61 North Third street, Easton, Pa. General alterations (interior), plumbing and heating. Contract awarded to Bechtel & Bechtel, Easton, Pa.

Residence (add.), Spring Garden, Easton, Pa. Architect, J. M. Shnyder, Trust Building, Easton, Pa. Owner, Dr. E. M. Green, on premises. Brick, 2½ stories, 14x14 feet, slate roof, hot water heat, new plumbing and heating. Contract awarded to Bechtel & Bechtel, Easton, Pa.

Branch Office Building, Marcus Hook, Pa. Architects, Savery & Scheetz, Stephen Girard Building, Philadelphia. Owners, Cambria Trust Co., Chester, Pa. Brick and terra cotta, 2 stories, 30x50 feet, slag roof, pine and terrazzo floors, metal lath, stone foundations, hollow metal sash, iron work (plumbing, heating and electric work reserved). Contract awarded to Wm. Provost, Jr., Chester, Pa.

Woodoleum Flooring

You are safe when you buy a Woodoleum Floor.

You get an absolute and unqualified guarantee. You get a concern which is the pioneer in this line of floor coverings.

There is but one Woodoleum—accept no imitation.

Woodoleum Mfg. Co.

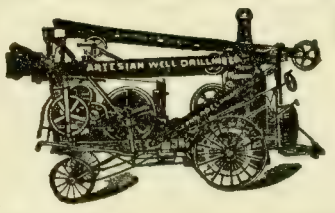
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

New Jersey Construction News

Police Station (alt. and add.), Chancery street, Trenton, N. J. Architect, J. O. Hunt, Montgomery avenue, Trenton, N. J. Owner, City of Trenton, care of George La Bar, City Commissioner, City Hall, Trenton, N. J. Steel, concrete, fireproof, 3 stories and basement, 60x90 feet, concrete roof and floors, vacuum steam heat, electric light, rolled steel sash and skylights, fire doors, steel cells, iron stairs, ornamental iron work, roof ventilators, metal window guards (plumbing, heating and jail equipment reserved). Architect has received bids.

School (alt.), Wrightstown, N. J. Architect, H. A. Hill, Broad Street Bank Building, Trenton, N. J. Owner, School Board of New Hanover, Ed. L. Davis, president, Wrightstown, N. J. General interior alterations. Board will take bids this week.

Store, Trenton, N. J. Architect, William Kleman, First National Bank Building, Trenton, N. J. Owner, Mrs. Wallace, care of architect. Brick, 2 stories, 110x16 feet, slag roof, electric lighting. Architect has received bids.

Garage and Sun Parlor, Ivy Court, Trenton, N. J. Architect, J. O. Hunt, Montgomery avenue, Trenton, N. J. Owner, Henry A. Ludeke, on premises. Brick and concrete, 2 stories, 18x21 feet, shingle roof, concrete floors, electric light. Architect ready for bids.

School, Corkstown, N. J. Architect, H. A. Hill, Broad Street Bank Building, Trenton, N. J. Owner, School Board of New Hanover, Edw. L. Davis, president, Wrightstown, N. J. Frame, 1 story, 75x40 feet, shingle roof, maple floors, electric lighting. Board will be ready for bids this week.

School (alt. and add.), Lakewood, N. J. Architects, Fowler and Seaman, Broad Street Bank Building, Trenton, N. J. Owners, Newman School, care of architect, Lakewood, N. J. Brick, concrete and stucco, 2 stories, 60x25 feet, concrete foundations, shingle roof, beech floors, hot water heat, electric light, marble work, roof ventilators. Architects taking bids due June 7th. Lakewood Cont. & Bldg. Co., Newman & Newman, both of Lakewood, N. J.; Charles Y. Barlow and Jackson Bros., Trenton, N. J., are figuring.

Community Building and Parish Hall, Sayreville, N. J. Architects, Berry and Cummiskey, Real Estate Trust Building, Philadelphia. Owners, Roman Catholic Church of Our Lady of Victory, care of Rev. William M. Gilfillan, Sayreville, N. J. Frame and stucco, 1 and 2 stories, 57x129 feet, asbestos and slate roof, maple and pine floors, concrete and brick foundations, electric lighting. Owners will build and are taking sub-bids.

Church, Riverton, N. J. Architect, C. Henry Wilson, 1928 South College avenue, Philadelphia. Owner, St. Paul's Baptist Church, care of Rev. M. A. Foster, Riverton, N. J. Brick, 38x60 feet, asbestos shingle roof, maple floors, steam heating, electric lighting. Owners will be ready for bids in three weeks.

Residence (alts.), Ventnor, N. J. Architect, George S. Idell, 1705 Chestnut street, Philadelphia. Owner, Willard E. Cook, Ventnor, N. J. Interior alterations and new front entrance. Plans in progress.

Laundry, Girls' Home, Trenton, N. J. Architect, F. H. Bent, Capitol Building, Trenton, N. J. Owner, State of New Jersey, care of architect. Brick, 1 story, 81x43 feet, concrete foundations, slate roof, cement floors, steam heat, electric light, roof ventilators, wood tresses. Low bidder, C. Y. Barlow, Trenton, N. J.

Nurses' Home and Dining Hall, Sixth and Stevens streets, Camden, N. J. Architects, Morris and Erskine, 1716 Cherry street, Philadelphia. Owner, Cooper Hospital, Camden, N. J. Reinforced concrete and brick, 3 stories, 45x51 feet, and 1 story, 40x50 feet, slag and tile roof, reinforced concrete floors (electric light, plumbing and heating reserved), tile and marble work. H. E. Grau Co., 1707 Sansom street; R. C. Ballinger & Co., 218 North Thirteenth street, Philadelphia, and J. W. Draper Co., Camden, N. J., are figuring. Bids due June 15th.

Residence, Wenonah, N. J. Architects, Morris and Erskine, 1716 Cherry street, Philadelphia. Owner, A. H. Everhart, Wenonah, N. J. Frame, 2½ stories, 30x30 feet, shingle roof, pine floors, warm air heating, electric lighting, tile work. Owner is ready for bids.

Store House, Vineland, N. J. Architect, F. H. Bent, Capitol Building, Trenton, N. J. Owner, Feeble Minded Home for Women, care of Dr. Madelene Howell, Vineland, N. J. Brick, 1 story and basement, 81x49 feet, slate roof, concrete foundations, electric lighting, cold storage plant, reinforced concrete floors. Lowest bid submitted by Graham & Wells, 3649 Filbert street, Philadelphia, Pa., $33,931.

Septic Tank, Vineland, N. J. Architect, F. H. Bent, Capitol Building, Trenton, N. J. Owner, State of New Jersey, care of architect. Reinforced concrete, 12 feet high, 45x52 feet, new sewerage, cast iron and terra cotta work. Low bidder, George L. Robinson, 37 East Twenty-eighth street, New York.

Workshop, Bordentown, N. J. Architect, F. H. Bent, Capitol Building, Trenton, N. J. Owner, Industrial School for Colored Youths, Bordentown, N. J. Concrete, hollow tile and stucco, 1 story, 110x42 feet, stone foundations, galvanized iron roof, pine floors, hollow metal sash. Low bidders, Fenimore & Firth, Bordentown, N. J.

Bungalow, Atlantic City, N. J. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owner, Fred G. Nixon-Nirdlinger, 320 South Forty-sixth street, Philadelphia. Frame and stucco, 1½ stories and basement, 40x65 feet, asbestos shingle roof, oak and pine floors, vapor heating, electric lighting, tile and marble work. Architects taking bids due June 5th. Wilbert Beaumont, Hampton Bros., Newton W. Knauer, J. Mathis & Son and Andrew R. Scull, all of Atlantic City, N. J., are figuring.

Residence, Riverton, N. J. Architect, John F. Harbeson, 1535 Chestnut street, Philadelphia. Owner, Mrs. W. J. Curtis, Jr., Riverton, N. J. Hollow tile and stucco, 2½ stories, 32x90 feet, slate roof, oak floors, stone foundations, hot water heat, electric lighting. Revised plans in progress.

New Jersey Contracts Awarded

Church, Tenth and Ferry avenue, Camden, N. J., $19,000. Architect, C. Henry Wilson, 1928 South College avenue, Philadelphia. Owner, Tenth Street Baptist Church, care of Rev. John Saunder, 616 South Sixteenth street, Philadelphia. Brick and stone, 40x80 feet, slate roof, hardwood floors, stone foundations, steam heating, electric lighting, stained glass (church furniture and cabinet work separate bids), metal ceiling ventilators. Contract awarded to W. D. Peece, Glencove, N. J.

Court House (alt.), Belvidere, N. J., $20,000. Architect, E. H. Wenzelberger, Reeder Building, Easton, Pa. Owner, Board of Freehold-

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEET ROCK
WALL BOARD

SHEETS OF REAL ROCK

For Beautiful and Lasting Interiors

SHEETROCK is a large, sturdy sheet or board of pure gypsum rock, gypsum being universally recognized as the most efficient material for permanent, substantial walls and ceilings.

SHEETROCK is manufactured by moulding and compressing pure gypsum rock, in plastic form, between two layers of tough paper specially made by us, and alum-sized to minimize the cost of decoration. After moulding, the gypsum recrystallizes—returns to rock.

SHEETROCK is furnished in large convenient sizes. A few boards will complete the average room. The boards are nailed to the studs, joists or other supports; or directly over old walls, brick or concrete surfaces.

SHEETROCK takes any form of decoration. It may be left in its natural silver-gray finish, painted or wallpapered. Joint tape, muslin or lining paper can be used before decorating. Any decoration can be paneled if desired.

SHEETROCK walls are permanent—they will not warp, buckle, shrink nor burn. The **SHEETROCK** Trade Mark on the back of each Board is your guarantee.

Advantages Over Other Boards

Insures against fire and climatic conditions.

Won't Burn, Warp, Buckle, Swell Nor Shrink

Is stronger and more rigid.

Is quickly and easily applied.

Can be painted beautifully.

Can be wallpapered with greatest satisfaction.

Adapts itself ideally to panel treatment.

Can be finished in flat surface by use of Joint Tape.

Saves fuel—more heat and cold-proof.

Resists sound—makes more quiet interiors.

Is vermin-proof and sanitary.

Costs no more than other wall boards.

Is economical and permanent.

No Plaster **No Lath** **Less Labor**

School Building, No. 65, Baltimore, Md. Architect, E. H. Glidden, Baltimore, Md. Owner, Board of School Commissioners, Baltimore, Md. Granite, stone, brick and steel, 3 stories, 111x63 feet, slag roof, metal lath, pine and granolithic floors, roof ventilators, metal ceilings, waterproofing, dampproofing, iron work and stairs, fire escapes, electric lighting, steam heating. Lowest bid submitted, $399,000, by Standard Const. Co., 1713 Sansom street, Philadelphia.

Proposals

INVITATION FOR PROPOSALS

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 7, 1920, for furnishing certain materials for the construction of the main hospital, transformer building, gas house, and an extension to the present boiler house for the United States Public Health Service Hospital at Sewell's Point (Norfolk), Va., including reinforcing metal, structural tile, gypsum blocks, miscellaneous iron work, sheet metal work, hollow steel doors, interior marble and slate, mill work, fly screens, linen chutes, hardware, plumbing, heating, electric work, etc., in accordance with drawings and specifications, copies of which may be obtained from the Medical Officer in Charge, U. S. Public Health Service, Custom House, Norfolk, Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

INVITATION FOR PROPOSALS

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 7, 1920, for furnishing certain materials for the construction of the main hospital, transformer building, gas house, and an extension to the present boiler house, and certain approach work for the United States Public Health Service Hospital at Sewell's Point (Norfolk), Va., including materials for mortar, concrete, macadam, brick work, waterproofing, plastering, lumber, painting, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained from the Medical Officer in Charge, U. S. Public Health Service, Custom House, Norfolk, Va., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

INVITATION FOR PROPOSALS

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 7, 1920, for furnishing the necessary labor and materials for the composition roofing, stucco work, and cork insulation required in the construction of the main hospital, transformer building, gas house, and an extension to the present boiler house for the United States Public Health Service Hospital at Sewell's Point (Norfolk), Va., in accordance with drawings and specifications, copies of which may be obtained from the Medical Officer in Charge, U. S. Public Health Service, Custom House, Norfolk, Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 22, 1920, for furnishing materials for the construction of an extension to the Animal House for the Hygienic Laboratory, United States Public Health Service, Washington, D. C., including materials for concrete, reinforced concrete, brick, miscellaneous iron and steel work, composition roofing, sheet metal work, lumber, mill work, painting, glazing, hardware, plumbing, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed proposals will be opened in this office at 3 P. M., June 22, 1920, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of an extension to the Animal House, for the Hygienic Laboratory, United States Public Health Service, at Washington, D. C. Drawings and specifications may be obtained at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

(Continued from Page 516.)

P. R. R. tracks are already on Main Street, Camden, just under the proposed Bridge, and P. & R. R. R. very close to the western end, with B. & O. connection and P. R. R. near enough to connect without serious difficulty of expense.

The plans for the suggested location are the result of careful study of the conditions, the limitations and the opportunities involved, with only consideration of the interests of all the people, and without regard to private interests of any kind.

The heighth of the Bridge and consequent length of approaches as suggested are intended to meet present requirements of the Federal authorities for navigation.

It cannot safely be assumed that an experimental structure built over forty years ago and of high merit can be used in its entirety as a guide for present-day construction.

This plan is intended for today and the future, and is intended to be intensely practical, yet containing only suggestions of proven merit.

(Continued from Page 515.)

ing codes, retaining only the salient features, reducing them to their simplest terms, and recording their actual mandatory requirements. These are as follows:

BOSTON

The tensional stresses in the steel are fixed at 16,000 lbs. per sq. in. The standard mixture for reinforced concrete is 1 of cement, 2 of sand, and 4 of broken stone.

Extreme fiber stress in slabs and other units, 500 lbs. per sq. in. In special cases, as in columns with vertical and hooped reinforcement, 600 lbs. per sq. in. in compression is permitted.

Plain concrete in mass, in compression, 350 lbs. Wall thickness for houses: Basement, 12 inches; first and second stories, 8 inches. The use of cinder concrete is permitted in floor slabs, roofs or filling.

CHICAGO

Allowable stresses: Mild steel in tension—18,000 lbs. per sq. in:; extreme fiber stress in concrete, 35 per cent. of the ultimate crushing strength; direct compression, 20 per cent. of the ultimate crushing strength.

Various mixtures of cement, sand and broken stone are prescribed as follows: (Best) 1:1:2; 1:1½:3; 1:2:4; 1:2½:5; 1:3:7.

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

The crushing values of these respective mixtures are given as 2,900, 2,400, 2,000, 1,750, and 1,500 lbs. per sq. in.

Wall thicknesses are the same as for brick. Cinders: Clean, screened from ashes or other matter, are permitted except in bearing walls, columns or piers.

LOS ANGELES

Allowable steel stress—16,000 lbs. per sq. in.

Allowable stresses in concrete as follows:

Mixture: 1:2½:3½ crushed rock, extreme fiber stress, 650 lbs.; hooped col., 800 lbs.

Mixture: 1:3:4½ screened gravel, extreme fiber stress, 520 lbs.; dir. com., 350 lbs.

Mixture: 1:7 bank or river gravel, mass concrete; without reinforcement, dir. com., 250 lbs.

Walls—Plain concrete, same thickness as required for brick walls.

Block concrete, same thickness as brick walls.

Reinforced concrete, filler or curtain walls not less than 8 inches thick.

Los Angeles has the following provision for inspection:

The inspector must qualify. He must see that all work and materials comply with the requirements of the ordinance—or stop the work—upon penalty of a fine of not more than $500, or imprisonment for not more than six months, or both.

NEW YORK

Allowable steel stress, high carbon steel, or cold drawn wire or fabric, 20,000 lbs.; mild steel, 16,000 lbs. per sq. in.

Mixture, for reinforced concrete—1:2:4 or better, with a crushing resistance of not less than 2,000 lbs. per sq. in. at the age of 28 days.

The aggregate to be screened, crushed stone, or gravel.

Extreme fiber stress in concrete, 650 lbs.

Direct compression, 500 lbs. per sq. in. on the concrete, plus 9,000 lbs. per sq. in. on the vertical steel reinforcement.

Mixture for mass or plain concrete, 1:2½:5.

Aggregate to be granite, trap rock, or gravel—thoroughly cleaned.

Walls: Foundation walls for residences not less than 12 inches of reinforced concrete, 8-inch walls, 20 feet high, are allowed above the basement; 30-foot walls are permitted, if the first 10 feet in height is 10 inches thick.

Cinder concrete is permitted in floor slabs, in reinforced partitions 4 inches thick, and in plain partitions 5 inches thick.

PHILADELPHIA

Value of steel, 16,000 lbs. per sq. in.

Extreme fiber stress in concrete, 650 lbs.

Direct compression, 500 lbs; allowed compression on plain concrete in walls or large piers, 250 lbs. per sq. in.

Mixture: 1:2:4, to develop a crushing strength of 2,000 lbs. per sq. in. in 28 days.

Aggregate—Stone, gravel, or slag.

Cinder concrete permitted for slabs and minor partitions, mixture, 1:2:5, and should develop a crushing strength of 800 lbs. in 28 days.

For cinder concrete the allowed extreme fiber stress is 300 lbs.

Reinforced concrete will be approved for all types of building construction, provided the design conforms to the requirements of good engineering practice, and the working stresses do not exceed those established in the code.

Walls of reinforced concrete may be 66 per cent. of the required thickness for brick walls; the concrete to be reinforced with approximately 1-5 of 1 per cent. of the cross section.

Concrete blocks 1:2:3 mixture of sand and gravel may be used in house construction, in walls of the same thickness as brick walls.

A system of rigid tests is established.

Only high grade portland cements are considered in any of the building codes to which reference is made.

As an illustration: a good reinforced concrete house, having horizontal dimensions of 30 feet by 40 feet, and an average height above the basement of 20 feet, would weigh, including outside walls, floors, partitions and roof, approximately 10 tons—and if all the floors were loaded to their full carrying capacity of 40 lbs. per sq. ft., it would add about 50 tons more. The weight of the whole building, above the basement, together with its live load, could be safely supported upon one well designed concrete column 23 inches in diameter. In the vertical supporting members in a typical concrete house there is material sufficient to make 25 such columns.

Now this is extravagant designing—an unnecessary waste of valuable material. The designers are not encouraged to apply their inventive genius, or even the best of their training and experience, but in many cases are restrained and handicapped by the requirements of existing building codes—codes that are influenced by other codes, which in turn are influenced by older and different methods of building. There is no logical reason why concrete construction should be measured in multiples of 4, 8 or 12 inches, just because brick and stone are figured that way.

To begin with, portland cement concrete is a comparatively new material, and new uses for it are being discovered every day. Until very recently the concrete house was designed on the same lines and with the same details as a brick or stone house. And it was but natural that existing or incongruous building regulations should be applied to it.

But we are progressing. The engineers have led the way, showing us how to build with concrete scientifically and safely. The factor of safety can be very greatly reduced when ignorance, dishonesty, and carelessness are noticeably reduced, and better controlled.

The men who are really responsible for our biulding codes have worked to get away from archaic methods, have had to oppose ignorance, perversity, and the entrenched interests. They have had to arouse and mould public opinion, and receive its sanction, before they could establish and maintain necessary reforms, or enact building codes.

With a slight improvement in the intelligence and reliability of the average man, and a better and more universal understanding of the proper treatment and behavior of concrete—in all places and under all conditions—great economies both in the material and manipulation can be effected, and satisfactory results obtained.

Our building codes are primarily written and enforced for the dual purpose of protecting human life and the prevention of fire. They must occasionally be revised, so as to comprehend new materials, and new methods.

The concrete house of various types of construction will gradually and shortly come to be considered on its own intrinsic merits, and building codes will contain provisions that will be specially applicable to such houses.

The concrete house, with its unlimited opportunities for style, finish and decoration, has a value and a charm all its own. The designer should bear in mind that he is expressing himself in terms of concrete, and also that it is a medium worthy of his best thought and his noblest effort.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Brownstone Bricks

Reading Sidings.

These are high grade pressed bricks, manufactured of crushed stone and hydrated lime. Greater crushing strength and lower absorption than burned clay. Uniform in shape and size. No soft ones. They are beautiful, economical and everlasting.

Red, Gray & Buff Face Bricks

A complete range of colors. Manufactured of vitrifying shale and fire clay. Our prices defy competition.

Straight Hard, Stretcher and Salmon Bricks

All Shale Bricks in carload lots, delivered on job at competitive prices. We are shipping 200,000 bricks daily to 28 building operations.

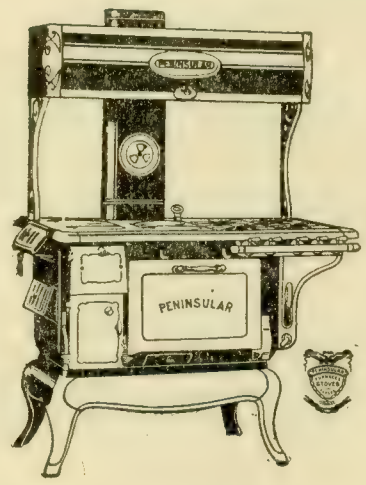
Erie Shovel in good operating condition.

Thew Shovel for rent.



Iroquois Asphalt Plant, 1250 yd. capacity, new.

Hoists, Gasoline Engines, Road Forms.

SERVICE EQUIPMENT COMPANY

Bourse Building, Philadelphia, Pa.

Lombard 490

A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.

A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

KLEIN STOVE CO.

Front St. & Fairmount Ave.

Bell Phone, Market 3879 **PHILADELPHIA, PA.**

CARTER CONCRETE

The Kind That Lasts

Carter Concrete **PAVEMENTS, FLOORS, CONSTRUCTION—BUILT BY SPECIALISTS SINCE 1888—BUILT TO PREVENT CRACKING, CRUMBLING and DECAY—BUILT TO LAST.**

ORIGINAL COST OF *Carter Concrete* LOW—UPKEEP COST NEGLIGIBLE.

SPECIALISTS IN CONCRETE ROADWAYS

One of our Engineers will help you in Concrete Problems and gladly give you an Estimate.

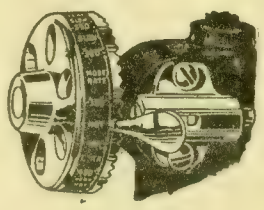
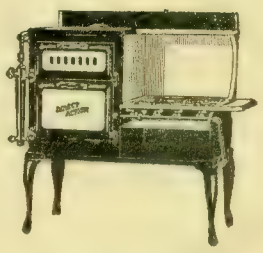
Place your orders with us. We have for years satisfied our customers. **WHY NOT YOU?**

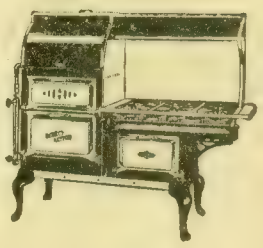


P. H. FAIRLAMB CO. - 115 to 121 S. 30th Street Philadelphia

One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range





is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

BORDEN STOVE CO., 1311-1313 Arch St. Phila.

The Touraine Apts, 1520 Spruce street; the Daniel E. Hogan Operations at 54th and Wynnefield avenue, and 60th and Columbia avenue; the William Pilton Operation at 5959 Larchwood avenue; and the Presser Operation at Yeadon, Pa. are a few of the many operations which are enjoying the advantages of the DIRECT ACTION GAS RANGE.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

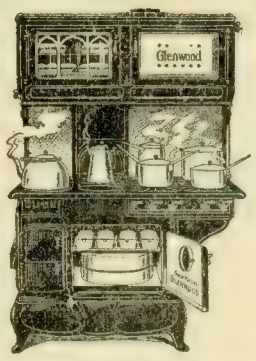
THE MOST FOR THE MONEY

Your clients don't want a cheap water heater—they want hot water economically.



There's a difference. Cheap water heaters cost too much to have around.

Humphrey Automatic Gas Water Heater service appeals to the householder as the ideal, dependable hot water supply. Get the details. In the interest of your patrons specify the Humphrey.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintaims an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

As The Editor Sees It

AT the recent convention of the Chamber of Commerce of the United States, held in Atlantic City, Homer Ferguson, a president of the Chamber, said that one of the great troubles with employers is that they are confining most of their efforts in meeting the many pressing problems of today to talking about them.

We are of the opinion that this complaint is not confined to employers, but has spread through the nation and attacked public official employer and employee alike. We have been fed up, during the past year, on reports from investigating committees and are still hungry for real results and solution of our many problems.

Not least among these is the still unmet housing shortage. Chicago, however, is an example of a city which is actually doing instead of talking. In fact, the first 175 houses of the 10,000 planned by the Chicago Housing Association are nearing completion in South Chicago and were visited by several hundred persons. Three thousand applications are on file for these 175 houses. Applicants must be American citizens and preference will be given those who have children and are poorly housed at present.

The association was formed to make it possible for small wage earners to own their homes. The buyers will pay $33 or $35 a month, of which only $9 or $10 will be rent, the balance being applied on the purchase of the homes over a period of fifteen years. The cost will be about $4500 for corner houses, $4250 for double English style and $4000 for the others. The first houses will be completed about June 1st, the buyers to pay one-tenth of the price down and the rest in installments. The 175 houses will be dedicated July 4th. Mayor Thompson and Governor Lowden are expected to take part in appropriate ceremonies.

Each house has three bedrooms, living room, combination dining room and kitchen, pantry, bathroom, closets and cement basement containing laundry tubs.

There has been pledged $750,000 for the housing by a group of financiers who have thus put Chicago in the lead in the attempts to solve the housing problem.

* * *

THE town of Holyoke, Mass., has also solved the housing shortage problem in a very effective manner, and the Holyoke National Bank has shown one way in which some houses can be built. This bank makes a construction loan to any approved builder for any family in Holyoke and the neighboring towns which has had $1000 on deposit in its savings department for the preceding six months. After the house is completed, the bank will make an effort to obtain for the owner a savings bank loan for 50 per cent. of the actual cost of house and lot. The difference between the savings bank loan and the cost of the property, less the amount of the owner's money used, the bank carries at 6 per cent. interest. While building, $1000 of the depositor's money is taken to buy the lot and start the house. The bank provides $4000 to complete the house. When completed, the loan will stand at $2500 in the savings bank loan, $1000 of depositor's money, and $1500 to be paid the Holyoke National Bank at 6 per cent. interest in weekly or monthly payments. The bank is applying half a million dollars for the purpose. Within a few weeks, in March of this year, 31 homes were being built under this plan, every house lot being large enough for a garden. Thus this Holyoke bank is using a portion of its funds for the necessities of its own community, instead of using them for "high-grade securities," financing Wall Street, and inflating commercial enterprises.

The home-owning idea should not be made into merely a passing fad; it should be a permanent national policy.

The trade paper is not only gaining in the esteem of the world, but it has ever led the work for purity in advertising and honesty in journalism.

STYLES FOR STUCCO MODERN ENGLISH COUNTRY HOUSES

BY DONALD O. DUNN

In these days of quantity production and industrial achievement, it may seem strange to speak of art as vital. Specialization is now the watchword in nearly all lines of endeavor. Even in architecture the structural and mechanical ends of the work have become professions in themselves, with the result that the structural engineer and the ventilating expert are all too prone to look on the architectural designer as a mere "milliner in stone," whose sole function is to please the public by dressing up the steel work with facades and interiors that conform to the style that is in favor at the moment.

Nevertheless architecture is the most vital of the arts with which we, as a people, have to deal; and the work of the men who practice it is a large factor in shaping the public conception of artistic matters generally. Yet a great many people have very limited ideas of architectural styles; particularly as to when various materials can be used without violation of the aesthetic principles of design. Perhaps the best example of this is the adaptation of various styles to stucco.

Stucco is plaster work—either exterior or interior—and may be applied on brick, tile, or metal lath. This seems simple enough, yet the layman will almost invariably limit its associations of this type of construction to bungalows or the commonplace type of small houses that has characterized some of our real estate developments.

To those who have traveled abroad, it will suggest the palazzi and garden architecture of Italy and the warmer countries. The Italians have always been sculptors and painters rather than architects. Even the structural grandeurs of Imperial Rome were accomplished largely by Greek artisans under Roman direction and patronage.

The flowering of the Renaissance in Italy saw a group of painters and sculptors impressing their personalities on the times through the medium of architecture.

Michael Angelo, Bernini, Sansovino, Bramante and a host of followers covered their buildings with a wealth of almost painted detail. The interest of economy coupled with a natural instinct for modeling resulted in an eager adoption of stucco, and much of the best known Italian work will be found upon examination to be of stucco. For this reason and the fact that the very name is an Italian word, many people associate stucco work almost entirely with Italy. Few indeed will associate it with colder climates, notably England, yet Edwin Lutyens, the prominent British architect, whose work has had so large an influence on the best contemporary in this country, has not hesitated to use it freely.

This is the more noteworthy since Mr. Lutyens was recognized early in his career as a master in the use of materials. He was constantly trying new combinations but always leaned strongly toward those which offered the most plastic medium for the expression of his ideas. Brick, ashlar, chalk, black flint and stucco all served their turn according to the local conditions and to the peculiar requirements of the problem.

Perhaps the most charming example of his earlier work is "Goddards," built for Sir Frederick Mirrillees as a Home of Rest for poor women. It stands near Leith Hill in Surrey. A more delightful variety, both in plan and in the varied use and treatment of materials would be hard to imagine. The contrast of its chimneys and brick, mullioned windows with the stucco walls is the keynote to its charm.

The house itself is in spirit of the best Surrey tradition of building, but with greater freedom in the handling of the materials, and a natural rather than a studied picturesqueness. Narrowly it might be called Tudor, but Lutyens has never allowed himself to be bound by stylistic considerations wherein he differs from the majority of his American contemporaries.

Our national state of mind, architecturally, is the result of a perfectly natural sequence of events.

Our colonial ancestors brought with them to this country the building traditions of their day.

Fundamentally they were English and familiar with the Georgian work of their period. Naturally difficulty was experienced in obtaining building materials for this style of architecture in the colonies. Only the more well-to-do could have bricks and cut stone brought from England, and this construction of their buildings soon gave place to wood. Fortunately, skilled ships' carpenters were at hand and the delicate wood mouldings that characterized the best colonial houses were the result of their craftsmanship.

But the Revolution and the War of 1812, broke down many ties with the mother country. Gradually the skilled artisans died off and were replaced by men of a rough and ready type, unskilled in the niceties of European craftsmanship.

The British blockade had forced the development of home industries and the fostering of these enterprises became a national policy after the war. Thus by 1830, our isolation from European influence became more complete, and little architecture of merit was produced after that date.

The best efforts of our people were devoted to pushing the western frontier across the continent. Our resulting prosperity, unguided by an architectural tradition, resulted in the so-called "Queene Anne" monstrosities of the eighties. The workmen were no longer skilled in the old world sense. Furthermore, their imaginations were not guided by the presence of great buildings of the past. Popular taste could not appreciate the refinement of our colonial heritage. Works of magnitude were undertaken by mere carpenter foremen and the invention of the jig saw coupled with the cheapness of lumber left an indifferent public at the mercy of these men.

Following all this came our gradual reintroduction to the great masterpieces of Europe. Increasing prosperity permitted more European travel with resulting demands for a higher grade of work at home.

Our students commenced to study abroad. After the provincialism of their native land, the beauties of Paris and Rome must have been overwhelming. They returned to a country that must have seemed to them inexpressively crude —artistically, at least.

Far from the shrines of European art, they strove for the most part for the technical perfection of mere architectural plagiarism. Many of our architects are even now content in merely aping the great monuments of Europe. The resulting tendency has been, of course, towards work that has a classical correctness, but in its timidity lacks any real vitality.

One of the strongest chains that binds the architect to the past is the habit of thought of his public. People who have been accustomed to seeing cornices on buildings cannot be reconciled in a night to a building with no more crowning member than an upended domino. So that few of our architects have been hardy enough to venture far from classical precedent.

Not so with contemporary Old World designers who have grown up in the very

Barrett Everlastic Roofings

Make Every Roof An Everlastic

ONE of the advantages of Barrett Everlastic Roofings is that they come both in shingle form and in rolls—two styles of each.

You can use some of these four styles to good advantage on any kind of a roofing job and get a low-cost, long-service roof, of which both you and the owner will be proud.

Both styles of Everlastic Shingles are surfaced with real crushed slate, in natural, soft color-tones of red or green. They are suitable for residences and other buildings that demand handsome as well as staunch roofs. You can't buy more artistic roofs *at any price.*

One style of the roll roofing is also slate surfaced in the same rich colors as the shingles. The other is plain surfaced, of the so-called "rubber" type.

Don't overlook these two important points: Everlastic roofings are easy to lay and there is no waste of materials. All four styles are briefly described here.

Barrett Everlastic Roofings are carried by enterprising dealers everywhere. If your dealer does not carry them, write us and we will tell you where you can be supplied.

Illustrated booklets giving full information, will be sent free upon request.

Everlastic Multi-Shingles.
(Four Shingles in One)

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

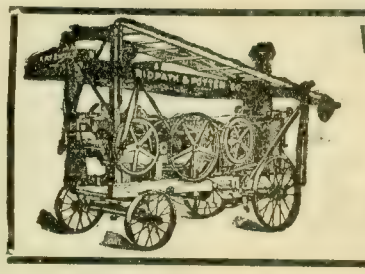
Store and Dwelling (alt. and add.), 2100-02



Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

How To Judge A Wood Preserver

"No-D-K"

An effective Wood Preserving Compound that is easily and quickly applied.

A GREAT many people will tell you that ***any*** Creosote is an effective preserver of wood. The same people usually will also say that Creosote which is strong enough to kill decay fungi in wood is dangerously poisonous to men and animals. Neither of these statements are literally true.

Coal tar Creosote is poisonous to men and animals and it is ***not*** an efficient preserver of wood. Wood Creosotes are poisonous only to wood fungi and those of certain woods are much more effective than others.

But a wood preserver must be more than merely toxic to fungi to be efficient. It is of value in proportion to its degree of effectiveness in fulfilling the following conditions :—

It must be powerfully poisonous to fungi but non-injurious to men or animals.

It must penetrate the wood fibre thoroughly and quickly.

It must be low enough in cost to be used economically.

It must ***not*** be affected by weather temperatures or the rays of the sun.

It must ***not*** be effected by storm or moisture.

One or more of these properties are found in several materials used for wood preserving. You should never use a preserver which does not have them all. "No-D-K" possesses all of these properties in a proportionate combination of ingredients which makes it thoroughly dependable in every way. It can be applied either with a brush or by immersion with equal success Its cost is relatively low. Ask for analytical booklet on wood conservation or have a Bond salesman explain "No-D-K" to you You will learn much about the preservation of wood that you ought to know. There will be no obligation on your part.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

New interior work, maple floors, electric light, tile, marble and terrazzo work, hollow metal sash, roof ventilators. Contract awarded to H. H. Focht. Reading, Pa.

Bank and Office Building, Cynwyd, Pa. Architects, Savery and Scheetz, Stephen Girard Building, Philadelphia. Owner, Merion Title & Trust Co., Ardmore, Pa. Brick and terra cotta, 1 story, 76x34 feet, slag roof, pine and terrazzo floors, metal lath, iron work, stone foundations (heating, electric lighting and plumbing reserved). Contract awarded to John E. Kearney, Middle City Building, Philadelphia.

New Jersey Construction News

Residence (alts. and add.) and Garage, 180 West State street, Trenton, N. J. Architects, Dreher, Churchman, Paul and Ford, 1424 Walnut street, Philadelphia. Owner, Mrs. Thomas S. Chambers, on premises. Brick, 1½ stories, 18x22 feet, slate roof, cement and pine floors, stone foundations, hot water heating, electric lighting, carpentry, mill work, painting, glazing, hardware. Architects taking bids due as soon as possible. Frank G. Stewart, 1619 Sansom street, Philadelphia, is figuring.

Convent, Trenton, N. J. Architects, Henry D. Dagit & Son, 4527 Pine street, Philadelphia. Owners, St. Mary's Roman Catholic Cathedral, Trenton, N. J. Stone, brick and steel, tin roof, oak, tile and maple floors, marble work, metal lath, roof ventilators, waterproofing, iron work, kalamein doors, electric lighting, steam heating, stone foundations. Architect taking bids due June 14th. William R. Dougherty, 1610 Sansom street, Philadelphia; M. Melody & Son, 1322 Race street; William J. McShane, 417 South Thirteenth street, Philadelphia, and George O. Deitrich, Riverside, N. J., are figuring.

Schools (2), Siclerville, N. J., and Cedar Brook, N. J. Architect, Arnold H. Moses, 136 South Fourth street, Philadelphia. Owner, Township of Winslow, Horace Angelow, Clerk, Berlin, N. J. Brick, 1 story, 40x60 feet, slag roof, pine floors, stoves. Plans about completed. Will be ready for bids in a week.

Amusement Building, "Rendezvous," Atlantic City, N. J. Architect, Philip M. Jullien, Commercial National Bank Building, Washington, D. C. Owner, S. Bernard November, Equitable Building, Baltimore, Md. Details undecided. Plans in progress.

Community Building, Millville, N. J. Architect, Arnold H. Moses, 136 South Fourth street, Philadelphia. Owner, City of Millville, Millville, N. J. Brick and reinforced concrete. Preliminary plans in progress.

Residence, Merchantville, N. J. Architect, Arnold H. Moses, 135 South Fourth street, Philadelphia. Owner, name withheld. Brick and hollow tile, 2½ stories, 26x38 feet, shingle roof, stone foundations, hot water heating, electric lighting, tile work, hardwood floors. Plans in progress.

Nurses' Home and Dining Hall, Sixth and Stevens sts., Camden, N. J. Architects, Morris & Erskine, 1716 Cherry st., Phila. Owner, Cooper Hospital, Camden, N. J. Reinforced concrete and brick, 3 stories, 45x51 feet, and 1 story, 40x50 feet, slag and tile roof, reinforced concrete floors (electric light, plumbing and heating reserved), tile and marble work. Architect taking bids due June 20th. J. S. Rogers Co., Drexel Building; Robert E. Lamb Co., 843 North Nineteenth street, Philadelphia; J. W. Draper, Camden, N. J.; R. C. Ballinger & Co., 218 North Thirteenth street, and H. E. Grau Co., 1707 Sansom street, Philadelphia, are figuring.

Community House, Salem, N. J. Architect, Robeson Lea Perot, 34 South Seventeenth street, Philadelphia. Owner's name withheld. Concrete and stucco, 2½ stories, 50x60 feet, asbestos shingle roof, pine floors, stone foundations, hot air heat, electric lighting. Architect will be ready for bids in about three weeks.

New Jersey Contracts Awarded

Bank and Residence (alts. and add.), Third and Pine streets, Camden, N. J. Architects, Custer and Gill, Camden, N. J. Owners, First Italian National Bank, care of Antonio Depaolo, on premises. Brick, 2 stories, 68x8 feet, slag roof, tile floors, stone foundations, hot water heat, electric light, tile work. Contract awarded to Armand Menequale, 506 Linden street, Camden, N. J.

Pier, Camden, N. J., $100,000. Engineer, Fred Jasperson, 4927 North Thirteenth street, Philadelphia. Owners, Victor Talking Machine Co., Camden, N. J. Coal handling pier, reinforced concrete and steel. Contract awarded to J. E. Breneman Co., North American Building, Philadelphia.

Delaware Construction News

Residences (7), Vandever street, Wilmington, Del., $28,000. Architect, private plans. Owner, William M. Connelly, 1340 Reed street, Wilmington, Del. Brick, 2 stories, 15x42 feet, concrete foundations, slag roof, pine floors, pipeless heater, electric lighting, tile work. Owner will build.

Residence (alts.), Newark, Del. Architect, Benj. R. Stevens, 1737 Filbert street, Philadelphia. Owner, Frank Wilson, Wilmington, Del. Residence to be stuccoed, shingle roof, new floors, electric lighting, new porches, new partitions. Will be ready for bids in two weeks.

Residence, Granogogue, near Wilmington, Del. Architects, associated, Albert Spahr, Pittsburgh, Pa., and Robeson Lea Perot, 34 South Seventeenth street, Philadelphia. Own-

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

SHEETROCK

It Can't Warp—

It Stays Put

A sheet of pure gypsum rock, sheathed in a heavy protective covering, Sheetrock is the standard wall and ceiling material in unit form. It is fireproof. It cannot warp, shrink or buckle.

Sheetrock is rigid, tough and durable. It can be cut, sawed and nailed. It is quickly and inexpensively applied. It takes perfectly any form of decorative treatment.

Sheetrock jobs—new construction, additions and repairs—offer you good profits and a growing volume of highly desirable work.

Patented Reinforcement which insures extra strength in nailing, a tight-flush joint, and protection in handling.

Sheetrock comes in standard sizes: 3/8 in. thick, 32 or 48 in. wide and 6 to 10 ft. long.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 22, 1920, for furnishing materials for the construction of an extension to the Animal House for the Hygienic Laboratory, United States Public Health Service, Washington, D. C., including materials for concrete, reinforced concrete, brick, miscellaneous iron and steel work, composition roofing, sheet metal work, lumber, mill work, painting, glazing, hardware, plumbing, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed proposals will be opened in this office at 3 P. M., June 22, 1920, for furnishing the labor required in the construction complete, with materials that will be furnished by the Government, of an extension to the Animal House, for the Hygienic Laboratory, United States Public Health Service, at Washington, D. C. Drawings and specifications may be obtained at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervsing Architect's Office, Washington, D. C., May 31, 1920. Sealed proposals will be opened in this office at 3 P. M., June 14, 1920, for the mechanical equipment for main hospital building, transformer building, gas house, and extension to boiler house of the United States Public Health Service Hospital at Sewells Point, Norfolk, Va. Drawings and specifications may be obtained from the medical officer in charge United States Public Health Service, custom house, Norfolk, Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

PICATINNY ARSENAL, Dover, N. J. Sealed proposals for Alteration and Extension of Manufacturing Buildings at this Arsenal will be received until one o'clock P. M., June 11th, 1920. Address Commanding Officer.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

STYLES FOR STUCCO MODERN ENGLISH COUNTRY HOUSES

(Continued from Page 536.)

shadow of a great architectural heritage. Theirs is the assurance that can only come with long association. Their veneration for the "shrines" is tempered with a familiarity that permits them to work freely and unabashed by their antiquity.

As men of our own time, they have had to adjust their outlook to an infinite variety of problems in the planning and equipment of buildings. Constantly rising standards of physical comfort have demanded of them a machinery of living which would have staggered their predecessors. A maze of piping, vent ducts, conduits and wiring has to be built into walls and floors without marring the artistic effect of either facades or interiors.

How well such practical considerations have been met is evident when we think of the ingenious manner in which these elements have been hidden from view.

This aspect of building has been well served by modern mechanical development. Structural steel, reinforced concrete, hollow tile, sheet metal forms and a thousand other ingenious devices have diminished floor, wall, and column thickness to an astonishing degree. But the element that has aided the architect as perhaps nothing else, is metal lath. Its plastic character has made possible the reproduction of all types of intricate suspended ceilings and vaultings—the while being so thin as to permit of the greatest possible space in housing this mechanical equipment so essential to modern construction. All of which is an aspect of building which quite escapes the layman, as does the tremendous strides that have been made in the technical investigation of materials themselves. Micro-photography and industrial chemistry have taken building material out of the realm of guesswork, just as modern engineering has replaced the old time solution of structural problems. This mechanistic development has been admittedly greater in America than it has been abroad, and there has been of late a growing consciousness, not only of this, but of the fact that we—no less than the Europeans themselves—are the inheritors of the great building tradition that traces its origin to Greece and Rome.

Our better architects no longer feel that they must follow the Old World slavishly.

Instead there is a well-defined feeling that we are free to ransack the centuries for the architectural expression which best represent our needs and outlook on life. Correctness in modern design is best shown by a judicious handling of the various motifs, the absorption of their essentials and a fresh expression of the style chosen, "in the same language but with new phrases." Architecture can no more invent a new style than literature can invent a new language. To be guided by tradition, but be stimulated by new needs, is to produce fresh architecture instead of lifeless copies of the old. In this way the architect solves new problems with new materials and from the same fundamentals creates new compositions.

Lutyens has taken the best country house work of England, moulded it to his needs; and, in so doing has set the example for a new generation of architects on both sides of the Atlantic. These men are not only re-establishing principles of traditional domestic design, but they are discovering the right uses of material.

A characteristic example of work carried out in this spirit is the residence for Mr. James H. Foster, designed by Messrs. Walker and Weeks, of Cleveland. The house is located in a picturesque section of Ambler Heights, Cleveland.

The choice of stucco here was particularly fortunate, as the plastic character of the material lends itself readily to its irregular plan. The house owes its charm in a great measure to the fact that its picturesque character is in no sense forced, but is a direct and natural expression of the needs of the household.

The easy transition from the house to the garden, with its swimming pool, flower beds, and stone flagged walks is no small achievement in itself and is again traceable to the happy blending of the materials used. This feature once more proved its worth when, five years after building the house, the owner carried out extensive alteration additions, also in stucco.

Many laymen would have thought that a house as pretentious as the Foster residence should have been built of stone or at least of brick, in which case the cost would have been greatly in excess of that actually involved.

There then is economy, charm and facility of expression as well as execution.

The architects have achieved a practically fireproof building by their insistence that the entire basement ceiling be plastered on metal lath. With this vulnerable point protected, the fire resisting qualities of the house compare favorably with those of a much larger structure.

Lastly, this home was built in a climate popularly considered "too rough for stucco." The house, erected in 1912, has since stood the rigors of our northern winters to the entire satisfaction of both owner and architects, a tribute to the enduring quality of modern stucco work.—*General Fireproofing.*

MODERN STORE BUILDINGS

The year 1920 should prove to be a record breaker in the construction of store buildings. The merchants are prosperous, most of them having just concluded the busiest year they have ever had, and all signs point to an indefinite continuation of boom times. The up-to-date merchant realizes the value of a modern and attractive business place. Many of them have for years been looking forward to the day when it would be possible to have larger and more modern quarters, and the present period seems to offer the opportunity to the most of them.

For this reason it behooves the live builder to give some thought and study to this subject. The planning of the average store building is probably the simplest problem that a designer meets; the size and cost of course varies, but the elements of the plan are simple and have but a few variations. Store buildings on corner lots, however, sometimes develop into quite complicated problems and require considerable study before a suitable scheme is found.

The average store building consists merely of a rectangular box, the street side of which is glazed with plate glass. These windows are usually the only source of outside light, and in view of the fact that this source of light is often obstructed by solid panels to furnish a background for display purposes, it seems that top lighting by means of skylights should receive more attention than is customary. Of course, for stores housed in buildings more than one story in height, top lighting is seldom practicable, but for one-story buildings its adoption is recommended.

The fire regulations of most communities prohibit the use of wood for exterior use in business districts; therefore, only masonry walls will be taken up in this article. The exterior walls may be built of brick, concrete blocks, solid or reinforced concrete, or hollow tile. Roofs are usually flat and built of tar and gravel or prepared roofing. The roofs are supported on plank trusses set about two feet on centers, and the ceilings are formed on their under side. Fireproof

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

roofs and ceilings are made of thin, reinforced concrete slabs or of a combination of steel, gypsum block, or hollow tile fillers, with reinforced concrete joists. The combination type of construction is light and requires the minimum of form work. The top of concrete roof slabs is mopped with hot tar or asphalt and the roofing laid on this in the usual manner. Fireproof roofs involving long spans are usually framed with steel or reinforced concrete girders and beams on which the slabs are supported. Metal lumber is also recommended for fireproof roof framing. Ceilings are made of plaster on wood or metal lath, of sheet steel plates stamped in various patterns, or of ceiling lumber. Ceilings vary in height from 10 to 14 feet, or even higher, but 12 feet is the usual height. The walls for one or two-story buildings should never be less than 12 inches thick if built of brick, and for three-story buildings the lower wall should be at least 16 inches in thickness. It should be remembered that a wall has considerable tendency to buckle and that although a thinner wall might be ample in so far as crushing strength is concerned, it is safer to provide against collapse by increasing the thickness. It should also be remembered that a comparatively thin wall, well built, is stronger than a thicker one, poorly built. The bricks should be well soaked—not merely sprinkled—in water just before they are laid, and cement mortar should be used where extra strength is required. All mortar should be protected against freezing until it has set hard, and the top of freshlylaidwork should be covered during rain storms. The surfaces of green walls exposed to driving rain should be protected with tarpaulins. Green walls are often bulged or blown down by comparatively moderate winds, and for this reason a little time is well spent in bracing them.

Windows on side or rear walls should be guarded against entrance by thieves, by means of heavy bars or solid shutters. Solid shutters made of metal also offer considerable fire protection. Frames and sash made of metal and glazed with wire glass are highly efficient against fire. If rods are used as window guards they should be of steel securely bedded in the masonry at top and bottom and should be not less than ¾ inch in diameter and set not more than 8 inches apart. Extra long rods should have a cross bar tieing them together at the middle to prevent them from being sprung apart. Transoms over rear or side doors should also be guarded or omitted entirely and glass should not be used in such doors. Scuttles in roofs should be provided with sliding bolts on the inside, but key-operated locks should not be used for such purposes, as it may be necessary for firemen or others to have free access to the roof from the inside.

Interior partitions in stores may be made with wood or metal studding plastered on wood or metal lath. Or hollow tile or gypsum blocks may be used for this purpose. In one-story buildings, toilets may be lighted and ventilated by means of skylights if desired. The basement may extend under the entire floor if desired; may consist merely of a space for fuel and the heating plant, or may be omitted entirely and the heating plant placed in a shed extension of the main building. In any case the boiler room should be fireproof with masonry walls, concrete floor and at least a metal lath ceiling. In a building without a basement the floor may be made of concrete laid on a bed of cinders or gravel. Fireproof floors over basements may be made of reinforced concrete, or combination slab, resting on reinforced concrete, steel or metal lumber supports. Metal lumber is made of pressed steel and is light, strong and is cut to fit by the manufacturers so that it is easily and quickly erected. Every person interested in modern building methods should obtain catalogues and descriptions of the various uses to which metal lumber may be applied. Concrete floors may be grooved to form patterns and may be colored by means of mineral pigments incorporated in the wearing surface mortar, or they may be finished with a wooden floor laid on sleepers or special attachments embedded in the concrete base. If wooden floor joists are used where there is no basement below, ventilation to prevent rotting should be provided by digging out the earth for at least six inches below the bottoms of joists and by inserting grille ventilators in the walls under the joists. Roof spaces should also be ventilated by means of grille ventilators in the walls or with dome ventilators in the roof. Roof ventilation not only makes the building more comfortable, but also aids to prevent sweating of the ceiling. Masonry walls should always be furred for the same reason. The wall-furring may consist of wooden or metal strips, metal lath formed with ribs which hold the lath away from the wall, or by means of hollow bricks, and hollow tile or gypsum furring blocks. —*National Builder.*

IRON STICKS IN CONCRETE BY FRICTION

The essential factor in the resistance exhibited by reinforced concrete resides in the adhesion between the iron and the cement. This adhesion is usually attributed to a sort of gluing action between the iron and the cement analogous to that between bricks and mortar. This is denied, however, by a recent experimenter, M. Vasilesco Karpen, who has just laid the results of his investigation before the Academy of Sciences in Paris, says the *Scientific American.*

If the cement employed in making reinforced concrete is poured upon a sheet of iron the adhesion observed is very much less than that exhibited in reinforced concrete. Moreover, it depends essentially upon the state of the surface of the iron. For example, if this surface is smooth and oily there will be no adhesion. Experiments made with bars of iron which are imprisoned, show on the contrary that there is adhesion between the iron and the concrete even if the bars are painted or oiled, though in this case there can evidently be no question of any gluing action.

Mr. Karpen is of the opinion that this solidarity is due to the friction between the iron and the surrounding concrete. He calls attention to the fact that the concrete contracts while setting; the bar or iron imprisoned within it is therefore gripped firmly by the contracted concrete, so that if an attempt be made to withdraw it it will be retained by friction. We are obliged to omit the elaborate calculations which the investigator employs to prove his point, merely stating his conclusions. He finds that the adhesion between the materials increases with the lapse of time just as the amount of contraction of the concrete does. While it is quite true that iron can also be glued to cement, this gluing action is not only slight and uncertain in amount, but can exist only through the contraction of the concrete and must cease if the latter expands even very slightly.

Mr. Karpen was led to undertake the study of this question by the observation of reinforced concrete works in the process of being demolished. He noted that the concrete ceases to adhere to the iron unless the latter is entirely surrounded. As a general thing in the calculation concerning structures in which reinforced concrete is employed, no account is taken of the contraction of the concrete, since this factor is considered as being too uncertain. M. Karpen's theory, on the contrary, demonstrates that it is precisely this factor which produces the indispensable solidarity between the two materials, and shows the capital importance which must be attributed to the knowledge of the co-efficient of contraction of the concrete.—*National Builder.*

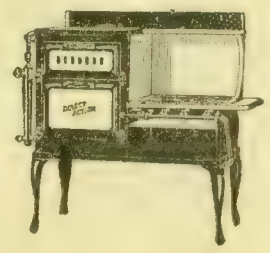
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

THE housing situation becomes more alarming every day. From every quarter come reports of doubled apartment rents, and houses sold over tenants' heads. People with children find it really impossible to lease an apartment, and, altogether there is a wild scramble to find shelter. House building should be going on at doubled speed, whereas in reality the amount of work being done is a mere drop in the bucket. Of course, the high cost of building prohibits a great deal of very necessary construction, and a concensus of opinion points to labor as a great factor in these high costs.

A three months' investigation of high building costs was recently undertaken in Cleveland, O., and in a report of the County Grand Jury in that city, the chief blame for the increases in building costs was placed on labor's refusal to do "a day's work for a day's pay."

The report followed a three months' investigation in which members of the jury heard testimony of more than 100 witnesses, including builders, dealers in material and supplies and representatives of labor organizations.

The report declares no evidence to indicate the existence of a combination or trust to keep up building prices had been found.

Workmen employed in building operations are doing less than one-half the work they did in pre-war times, the jury charges, and are receiving twice the wages.

In an interview by a representative of the *National Builder,* one of the biggest building contractors in the Middle West, one whose work is mainly the erection of structures costing hundreds of thousands of dollars or millions of dollars, said:

"No, I will not permit you to use my name at this time in an interview as coming from me. The situation in the building line is so delicate that anything I would say might come back to me and create an uproar among the other business men with whom I have to deal. Even a short truthful article in a daily paper the other day had that effect. Now is a time when every man connected with the building industry should take heed to what he says, and often it is better for him not to talk at all.

"As I see it, the present situation in building is due mainly to three things. One of these is the tyranny of the labor unions, which are making excessive demands and which precipitate strikes now in one line and now in another, till a building contractor is no longer able to estimate what any job will cost. The result is that things are kept stirred up and the whole building outlook placed in an uncertain state. While the effect on the men is to keep them in a mood to do less than a fair day's work, I am in favor of labor unions, but not in favor of the many things the labor unions are doing.

"The second great thing is the fact that the union laborers will not handle material that does not come from certain companies or that is not, as they say, union made. That prevents us from buying material where we could buy it at a fair price instead of at an excessively high price.

"The third factor is the combination that exists among the dealers handling some lines of building material by which a uniformly high price is made, but it is always practically the same price. I have told them in their meetings that this policy of fixing a price is all wrong and is also contrary to the laws of this country. I have warned them that they are laying themselves open to prosecution by the Government for thus acting in restraint of trade.

"They reply that they want to make some money. Well, I want to make some money also; but I want to do it in a fair way and in accord with the spirit of our laws that are made to prevent this very practice of price fixing.

"The fact that these things are not secret, that they are generally known by the people, is one reason why it is so difficult to finance new building operations or get people to put money into buildings at the present level of prices for material and labor."

BLUE PRINTS

AN average annually of 1,040,000 marriages in the United States as against 70,000 houses built in 1919, is the interesting contrast made by the manager of the St. Louis Housing Association at a recent address before the American Society of Mechanical Engineers. Only 20,000 houses were built in 1918 and 70,000 in 1919, according to this authority, who points out the need in this country of 3,340,000 additional houses. This association is building houses for workmen at cost and suggests that similar associations be organized in every city to prevent house famine.

Such statistics as the above emphasize the importance of "doing something" to relieve the situation, and not until the laboring man can be made to realize his immense responsibility in the matter, will the problem be ultimately solved.

It may be that we shall have to employ some such methods as England, for "Luxury building" in London has now been extended to "any building contemplated or in the course of construction which may cause a shortage of labor or material for the provision of dwelling accommodation." The London City Council has served notices on a number of firms ordering work to cease on their premises in respect to building or alterations. Among the firms receiving such notice are some of the largest department stores.

The chairman of the Building Control Committee of the London County Council is quoted in Daily Commerce Reports of the Bureau of Foreign and Domestic Commerce as saying that serious thought will be given before a ban is placed on the continuation of work in which highly skilled labor that would be of little use in the construction of dwelling houses is employed, and if a building would be a source of enormous local revenue or result in increased employment or would help increase export trade, its construction would doubtless be permitted.

FIRE prevention has taken on a new and greater significance due to the great scarcity of houses, and never before have fire losses and causes been so widely discussed. Many contradictory and misleading statements as to fire causes are almost as numerous as those who make them, if one may credit the fire reports printed in newspapers and other journals. In an address said to have been delivered at a recent convention with reference to wooden shingles it was stated that 90% of all the fires in large cities originated from roofs; another so-called "authority" is quoted in the daily press as saying that 95% of the fires in dwellings, where so many losses occur, start inside the house.

The sources of information for these two statements are of course not given, but if one may trust the official reports of fire chiefs in the country as compiled by such magazines as *Fire and Water Engineering* (and this would seem to be as authoritative and unprejudiced a source as could be secured) the fire losses in 1917 and 1918 show that 3% and 2.4% respectively of the total losses are attributable to "sparks on roofs." Reports from the same sources for the first quarter of 1920 indicates a great preponderance of fires in congested and business districts of our cities. Of the $67,000,000 fire loss during the first three months of 1920, $57,000,000 was of public and business buildings, and only about $3,300,000, or about 5% in dwellings. The greater part of the loss was therefore of buildings of fire-resistive or semi-fire-resistive construction and supposedly incombustible. It would appear that the great agitation directed in some places against shingle roofs and frame dwellings, might better be directed against the weakness in so-called incombustible construction, against carelessness and inadequate fire-fighting machinery.

Insufficient supervision by building departments of the greater part of new construction or installation of fire prevention equipment in public and business buildings, lack of efficient and consistent inspection of buildings after completion, as well as efficient building regulations are accountable for many of these preventable losses by fire which occur with seeming regularity.

The new Zoning Commission of Philadelphia which Mayor Moore recently appointed to provide regulations for the orderly development of the city in future years, will ask an appropriation of $20,000 to conduct its work during the remainder of the year.

Joseph E. Wagner, acting director of the Department of Public Works, was made president of the Commission and William C. Haddock, a former director of the Department, vice chairman, at a meeting held recently. John B. Sinkler, City Architect, will act as secretary, and three standing committees were selected to deal with the zoning problem.

George S. Webster, chief of the Survey Bureau, will head the committee on districting the city by height regulations, while the districting of the city so as to regulate the use to which buildings may be put will be in charge of a committee headed by Walter C. Ballenger. Milton C. Medary will be chairman of the committee in charge of regulations as to the area which buildings may be permitted to cover on a given lot.

WHERE PROFITS ARE LOST

To Enforce Some of the Innocent Looking Clauses Which Appear Commonly in Contracts Would Place Contractor's Equipment, Foremen, Profits, and Capital Under Absolute Control of Owner or His Engineer—Clauses Which Are in Effect Liens on Property and Waivers to Claims for Extra Work

By Royal A. Stone
Attorney-at-Law, Minneapolis, Minn.

IN one contract that we opened some time ago, we found in the specifications, and very deep in the specifications, sunk 'way down in the fine print towards the end, the following paragraph:

"Any omission to disapprove of the work of the engineer at the time of the monthly or other estimate being made, shall not be construed to be an acceptance of any defective work, etc."

You are all familiar with those general clauses in the contract. As I have indicated, the draughtsman of the particular contract went just as far as possible to confuse—he may not have intended to, but that was the result—so that the careless contractor might very easily be led into signing that contract without actually knowing what was in it. Thousands and thousands of such contracts have been signed by parties who knew what was in them.

I am going back to that first paragraph because it is objectionable from for a moment. This work must necessarily be done pursuant to the designs and under the direction of the engineer; but tell me, if an engineer comes along with a piece of railroad work or drainage canal and sees that the piece of work is boing done improperly, that the structure is contrary to the specifications, that it is inherently weak, has he any right to pass it up and in six months hence, after you have gone and after the outfit is moved somewhere else, to spring this specification and say, "You have got to go back and do it all over again?"

I think that a fair provision would be along this line:

(Continued on Page 569.)

Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Manufacturing Building, Allegheny avenue and Hancock street, Philadelphia. Architects, William Steele & Sons Co., 1600 Parkway, Philadelphia. Owner, Moss Rose Mfg. SHEETROCK

It Can't Warp—

It Stays Put

A sheet of pure gypsum rock, sheathed in a heavy protective covering, Sheetrock is the standard wall and ceiling material in unit form. It is fireproof. It cannot warp, shrink or buckle.

Sheetrock is rigid, tough and durable. It can be cut, sawed and nailed. It is quickly and inexpensively applied. It takes perfectly any form of decorative treatment.

Sheetrock jobs—new construction, additions and repairs—offer you good profits and a growing volume of highly desirable work.

Patented Reinforcement which insures extra strength in nailing, a tight-flush joint, and protection in handling.

Sheetrock comes in standard sizes: 3/8 in. thick, 32 or 48 in. wide and 6 to 10 ft. long.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

How To Judge A Wood Preserver

"No-D-K"

An effective Wood Preserving Compound that is easily and quickly applied.

A GREAT many people will tell you that *any* Creosote is an effective preserver of wood. The same people usually will also say that Creosote which is strong enough to kill decay fungi in wood is dangerously poisonous to men and animals. Neither of these statements are literally true.

Coal tar Creosote is poisonous to men and animals and it is ***not*** an efficient preserver of wood. Wood Creosotes are poisonous only to wood fungi and those of certain woods are much more effective than others.

But a wood preserver must be more than merely toxic to fungi to be efficient. It is of value in proportion to its degree of effectiveness in fulfilling the following conditions :—

It must be powerfully poisonous to fungi but non-injurious to men or animals.

It must penetrate the wood fibre thoroughly and quickly.

It must be low enough in cost to be used economically.

It must ***not*** be affected by weather temperatures or the rays of the sun.

It must ***not*** be effected by storm or moisture.

One or more of these properties are found in several materials used for wood preserving You should never use a preserver which does not have them all. "No-D-K" possesses all of these properties in a proportionate combination of ingredients which makes it thoroughly dependable in every way. It can be applied either with a brush or by immersion with equal success Its cost is relatively low Ask for analytical booklet on wood conservation or have a Bond salesman explain "No-D-K" to you You will learn much about the preservation of wood that you ought to know. There will be no obligation on your part.

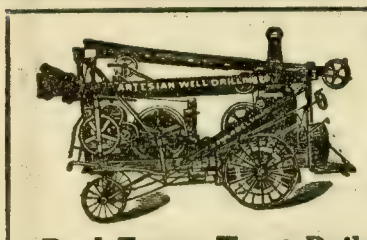
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.



This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

INVITATION FOR PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., May 24, 1920. Sealed Proposals will be opened in this office at 3 P. M., June 21, 1920, for furnishing the necessary labor and materials for the composition roofing, stucco work, and cork insulation required in the construction of the main hospital, transformer building, gas house, and an extension to the present boiler house for the United States Public Health Service Hospital at Sewell's Point (Norfolk), Va., in accordance with drawings and specifications, copies of which may be obtained from the Medical Officer in Charge, United States Public Health Service, Custom House, Norfolk, Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

WHERE PROFITS ARE LOST

(Continued from Page 556.)

"The failure of an engineer to disapprove in writing of any work claimed to be defective, as soon as the alleged defects are discovered or in the exercise of reasonable diligence shall be discovered by him, shall be deemed an acceptance of the work in question."

This is the rule which would be applied in court were it not for the contrary controlling provision of the contract.

Extra Work

Here is another very common provision, and in substance, a necessary provision:

The engineer may * * * * order extra work to be done or make any changes he may deem expedient * * * * and may furnish other plans. * * * * All such extras and changes must be directed by the engineer in writing, who shall fix the amount by which the cost of the work is increased or diminished. * * * Claims must be made monthly and * * * * shall only be allowed when the engineer has in writing authorized same and stated the prices to be paid therefor.

In substance, that is a necessary provision. It is the result of experience, but knowing that the legal profession is very fallible and that all of the inferior professions must be fallible, I think it is altogether too much power to grant the engineer. "He may furnish other plans"; he may change the whole scheme of the work, change the location, and absolutely disorganize the plans of the contractor. He may do it at any time after you have your outfit placed and after your work is started, and those provisions are the only covenant; and the other clause denies you any recovery for any loss of anticipated profits by reason of any such change.

I do not think the engineer ought to have a right so to change the plans that the entire nature of the work, from the contractor's standpoint, is changed. The contractor should have a right to elect—"I will go on with the work and perform the contract under your price, or I am through. You will pay me for my expense and loss of time." I think that would be a reasonable way to take care of a situation of that kind.

It is understood that in the event an engineer orders changes and extra work, the price fixed by the engineer must be a reasonable price. I think the contract ought to be so worded as to protect the contractor as to that phase of the question.

Now, to illustrate just what happens when two engineers fix the price. I was out on a trip recently, in connection with a project under construction, and the engineer for the public fixed the price of raising a piece of industrial track just a few hundred feet at $5,000, and the engineer for the railroad company fixed the price at $12,000. In a situation of that kind the contractor ought to be protected and it ought to be left for him to say whether he will go ahead or quit, and if he elects to quit, he ought to be paid for what he has already done.

The Weakness of Waiving Contract Provisions

If you are bound by such a contract you have a right, in case of any such change, to get that amount fixed in writing before you proceed. Some time I hope to find the case of a contract where a contractor who, when such provisions are in the contract, will insist on having in writing that which he is entitled to have in writing. So far such cases have been very few and far between. You have relied on the good faith of the engineer, but the trouble is, despite the best efforts of the engineer, despite his honesty, notwithstanding your own good faith, and your own constant efforts to complete your contract, you may get into court. That contract comes to a lawyer; he picks it up; he is there to protect the rights of his client, and his client may be the owner. The owner has the right under such a provision, before becoming bound by any charge for extras, to have it fixed in writing. The lawyer says at once, "Why, you are not liable for this. The matter was not determined by written decision of the engineer before he went ahead with the work."

There can be no recourse. What is the alternative for the contractor? This may represent the entire profit on the job, and that item may be the difference between future prosperity and temporary ruin—financial embarrassment. He can prove—he may attempt to prove—that that and other provisions of the contract have been waived. You can get away with it, ordinarily, but it is a costly proceeding.

Judge Caldwell, long on the Circuit Court of this district (St. Paul), once said in an insurance case: "Give me a policy and a fire and I will do the rest." Given provisions of this kind, given extra work, and ordinarily, the jury can be relied upon to do the rest.

When you are entitled to have anything in writing be sure that you get it, and get it when you are entitled to it. It is an easy thing to overlook in the rush and press of work, but remember that the work is being done under a contract binding upon yourself, under written language which will be interpreted in the end by somebody other than you and the other contracting party who adopted it, so check yourself up as you go along with the work and get that to which you are entitled.

Who Hires and Fires Your Foreman?

Another provision happens to accompany this:

"The contractor shall keep a competent foreman * * * * to be engaged and retained only with the approval of the engineer."

I do not think such a provision ought to be allowed in any contract because they are generally provisions which protect the owner. To give the engineer, in the ordinary case, power to discharge your foreman and select another one for you is taking the work out of your hands to such an extent as none wants to consent to in advance.

When Extra Work Is Done for Nothing

Here is another one along the lines of extra work. I said I was not going to

WHITEWASHING
COLD WATER PAINTING—

Whether applied by brush or machine, if done by our corps of trained artisans you are sure to get the best work at the lowest possible cost. Better see us today. "Let there be light."

WM. B. SOUTHERN
Manufacturer and Contractor
N. W. Cor. 12th and Spruce Sts.
PHILADELPHIA
Both Phones

criticize these provisions, but just give you the facts concerning them. One reason I am not going to criticize some of them is, I am trying to avoid profanity these days.

"All claims for extra work or material must be presented to the engineer for allowance at the end of the month."

So far so good. The owner has a right to demand that. The engineer is entitled to it. It is a matter of fair dealing between man and man.

* * * * in which the same shall have been done or furnished, and shall, if allowed by the engineer, be included in the estimate for that amount; otherwise all claim therefor shall be deemed to be absolutely waived by the contractor.

In other words, mere omission by your superintendent may cause you a loss beyond the power of your engineer to rectify, because your engineer cannot change this contract. If the engineer wants to put that in the estimate a couple of months hence, he will have trouble doing it against the efforts of the lawyer and the court, if the matter finally gets into court. Again, of course, you have the recourse of the waiver of provisions of that kind, but it is a dangerous recourse. It is an attempt to cure where prevention should have been used.

And right along this same line, read this:

"Every allowance * * * * shall be embraced in * * * * monthly estimates; but should the contractor have a claim which he considers is not included in any progress certificate, it will be necessary for him to make such claim in writing to the engineer within thirty days. * * * *"

That is fair enough, but read this:

"Unless such claims are thus made and are repeated in writing every month until finally adjusted or rejected, the contractor shall have no recourse against the company."

How many contractors have signed that contract? It has been very common. No owner's or company's protective provision is more common.

When Delay May Be Costly

Study this:

"The only recourse of the contractor in case of delay caused by the company in an extension of time for a period equal to the delay, and the right of the contractor to such extension shall be deemed to have been waived unless a claim therefor, stating the occasion and nature thereof, shall be made by him in writing, delivered to the company at the time of such stoppage or delay."

Another:

"If there be any delay in the work, upon the written directions of the company, or by reason of any cause for which the company is held responsible, the contractor shall have no claim for damage by reason of such delay, but the time specified for completing the work shall be extended for a period of time equal to the time of such stoppage or delay."

Notice the requirements, not originally, but as the work proceeds along:

"The contractor shall be at the risk of, and shall bear, all loss or damage whatsoever, and howsoever arising, which may occur to the work, until the same has been accepted by the company, and all damage occurring before acceptance shall be made good by the contractor."

That is, if you complete a piece of grade or any other work, although it is done so far as you are concerned, and the company delays you, causing you to lay up during the winter season, during the season of heavy rains, during the season of the greatest activity of disintegrating frost in the spring, through no fault of your own, the engineer has the right and it is his duty under that contract, to make you go back and do the finishing work over again, a very, very costly proceeding in some cases. Under such a provision an engineer by wilfully delaying acceptance of the work, may impose upon * * * * the contractor, not only a risk of damage, but a very, very certain conclusion that you are going to be damaged to an extent far beyond your profits.

This Clause Puts Lien on Entire Outfit

Here is a provision that is unusual, with which you may disagree, because you may have seen it more than I have:

"All machinery and plant provided for the work shall * * * * become and, until completion of the work, remain, the property of the company, for the purpose of said work, and shall not be removed or be disposed of other than for said work, without the consent in writing of the engineer. Provided, however that upon completion of the work and upon payment by contractor of all moneys due from him to the company, such of the machinery, plant, and materials as shall not have been converted in the works and remain undisposed of, may be removed by the contractor, at his own expense."

In other words, the builder, in that case the owner, or company, makes you give him a lien upon your entire outfit for the security, first, of your execution of the work, and, second, for the security of any sum which you owe the company for the privilege of working for him. What is the effect of such a provision? I do not believe it is equitable. I do not believe that the sense of the contractors of the Northwest—I do not mean that as a question of the good sense of your combined judgment—is going to tolerate the continuation, if it is being used, of the use of that provision.

Getting the Contractor Going and Coming

And here is the supreme limit in the way of language of some general counsel somewhere—I won't tell where—I happen to remember the contract myself—in the way of inserting into a contract a provision unquestionably unfair, absolutely damnable in the injustice of the uses to which it may be put:

"Delivery to the company, if required, of a valid release of all claims in respect to matters connected with or arising out of this agreement; the furnishing of such certificate, evidence and release being a condition precedent to the right of the contractor to receive payment in respect of the final estimate."

In other words, if you get to the fighting point and want to sue on account of the work you have done, before you sue you have got to acknowledge receipt of payment of that work. That is what it amounts to, and that, more than anything, is a good illustration of the extent to which gentlemen of my profession, working for only one side of an interested group, as they should—for lawyers cannot serve two masters any better than anyone else—that is an illustration of the extent to which that system goes. The remedy is for these contracts to be drawn as other contracts are drawn, so as to represent the combined judgment of the owner on one side and the contractor on the other, as to what is fair concerning the work to be accomplished.

How to Obtain Fair Contracts

Hereafter, that sort of contract can be worked out by contractors. It is certainly within your power to compel the elimination from the contracts under which you must proceed, of any such provision as that. If that contract is drawn by one party, of course, it represents the interest of that party, whether he is the owner or the contractor, and the general conclusion, the general recommendation to which I want to call your attention, is that hereafter contractors owe it to themselves to see

**Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.**

that the contracts under which they execute their works represent their ideas as well as those of the owner.—*Associated General Contractors of America.*

SOMETHING FOR THE QUANTITY MAN

Know Your Own Business and Likewise Some of the Other Fellow's

By Arthur Leslie Smith

How often has the writer heard these words. "I wonder what the architect means by this."

To begin with, how many quantity men are there that know their business and a little of the other fellow's, that is to know their line well enough to be able to interpret the plans and specifications, to be able to know what is wanted, even if it is not shown or called for.

For example, only a short time ago the writer was working on a set of plans, and among the other workers there was a "tile" man. When he got a chance he asked to be told how many floors there were to the building. It seems that the architect had only drawn basement, first and second floor plans, and showed on the elevations the building to be six stories high. Not knowing what to do this "tile" man asked the foregoing question. On looking at the second floor plan the writer found that the architect had lettered thereon the word "Typical," which solved the secret.

In a little while this same man was in trouble again. The specifications said that "all toilet rooms were to be tiled." The plans showed these rooms nicely marked with the words "Toilet room," but what troubled this man was that on one of the floors there was a room showing a basin, toilet and bath tub, but it was not marked. "What am I to do?" was again his question.

On another occasion a mill man listing off mill work was having his troubles. The specifications said that all exterior doors were to be made of oak and exterior windows of white pine. The plan showed openings from the living room to the veranda to be full length or to run to the floor. What worried this man was to decide whether these openings were exterior doors or casement windows.

And many similar "troubles" in all trades have come to the writer's notice.

Blaming the Other Fellow

The "boss" says that the quantity man does not know his business. The quantity man lays his troubles to the architect for not making "things clear." Who is to blame?

Of course we know the architect is getting paid to make a perfect set of plans. Does he do it?

And the quantity man is being paid to make a perfect list. Can he do it?

The quantity man knows that it is impossible to "come back" at the architect. Therefore, he must take the blame. But if he knew his business and a little of the other fellow's, there would be no blame to take; he would be in position to "talk back" to the architect and tell him what "ought to be."

Again we say, Mr. Quantity Man, know your own business, and likewise some of the other fellow's.—*Sheet Metal.*

CARE OF HARDWOOD DOORS AND TRIM

All woods are porous, and the drier and more thoroughly seasoned they are, the more readily they absorb moisture and are affected at atmospheric conditions. When unfinished hardwood doors and trim are placed in a damp room they quickly absorb the moisture in the air, which causes expansion or swelling, and when they return to normal (that is, when the moisture is again dried out) they are liable to warp and open at the joints, and it takes much time and labor to repair the damage. This can easily be avoided if only a little care is exercised.

In the first place, as soon as hardwood doors and trim are received, have a finisher give them one coat of filler, shellac or stain, as the case may require. The reason for this is that nearly all doors and trim are shipped "in the white," and all of the pores of the wood are open and ready to absorb moisture unless protected.

Do not hang doors or put on trim in a damp, freshly-plastered building. All hardwood finish should be back-painted with one heavy coat of asphaltum stain or lead and oil. This is to prevent absorption of moisture from the plaster. Mortar contains large quantities of water, and until the moisture is dried out of the walls the house is not in the right condition to receive hardwood doors, or any other fine woodwork which is quickly affected by such condition. Wood that is not back-painted is simply protected on one side and allows the moisture to come in on the other.

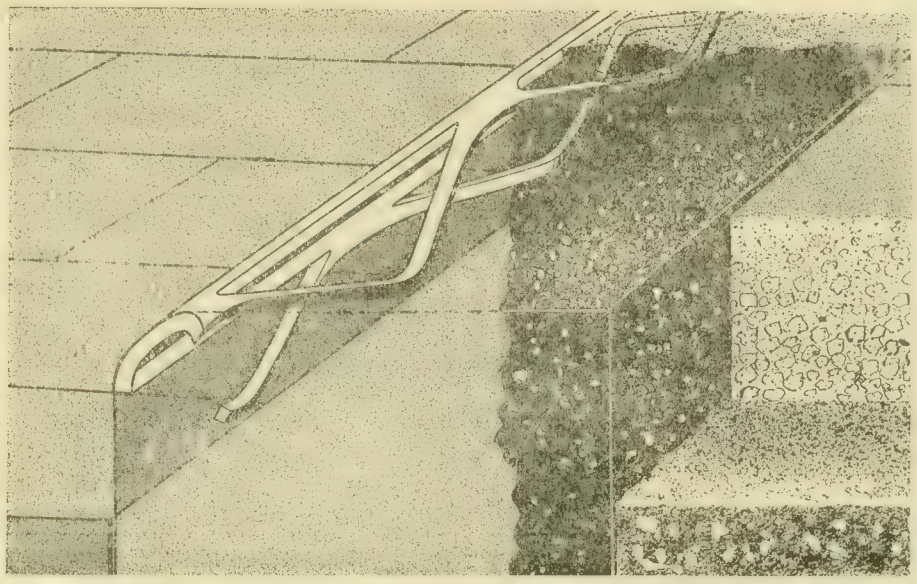
The manufacturer should not be censured nor the wood condemned if the product, upon which every care is exercised in the making, is not handled properly upon arrival at destination. Leading architects are specifying and insisting that heat first be turned on, so as to dry out the building thoroughly before hanging hardwood doors or putting on trim. If these hints and suggestions are carried out no trouble will be experienced. — *Red Gum Booklet — American Hardwood Mfrs. Asso.*

There have been many and varied solutions offered by men, big and little, widely known and obscure, for the so-called labor unrest. Also practically every organization, from Y huts to governmental departments, has given lengthy, wordy treatments to this subject. In fact, we are pretty well fed up on theories and solutions. Work is the best prescription of all—plain, honest, wholesome work. It is not only a sure cure for worry in the man who works, but if he will lay aside theories for a while and take up plain, honest work earnestly, most of the problems of the day will solve themselves, or rather will be solved thereby.

DON'T QUARREL WITH THE ARCHITECT

Mr. A. J. R. Curtis, of the Portland Cement Association, gave this advice to the Concrete Products Association members at their Convention in Chicago:

"Don't quarrel with an architect who wants to use your products and requires some special stunt with them. If he submits a design for a house and asks you to figure on it, say, 'Sure, we can figure it.' Demonstrate to him once and for all that your material is one that can be adapted to any design, any conditions; that it is a very flexible material to use—just as flexible as brick or frame. Don't let him think that your material is not as easy for him to use as those other materials. Adapt yourself as much as possible to what the architect asks for; put yourself in the position of the obliging storekeeper, who gives a man just what he wants and asks for, and doesn't try to give him an imitation that is just as good."—*Concrete.*



"Camouflage" doesn't pay in advertising. Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

As The Editor Sees It

THAT the lack of adequate transportation facilities is seriously affecting the construction industries is now a well established fact. In many cases concerns do not have goods to deliver and don't know when they will have.

According to a report by the Associated General Contractors of America, "the recent rulings of the Interstate Commerce Commission indicate that priorities are practically being established on account of the lack of transportation facilities. It is also evident that there will not be sufficient facilities to meet the full requirements of industry for some time to come and that some system of sharing the service must be devised. Under the present rulings, construction materials are forced to compete with luxuries and the least essential commodities for service. As a result coinstruction in many localities is practically at a standstill."

The Association is asking for data which will establish the right of construction materials to transportation subordinate only to food and fuel.

This fight is a step in the right direeection, and unless priorities for building materials can be secured, serious damage will be done construction and the public at large. Building is already so far behind that it needs every possible impetus for several years to come.

In a recent address by E. Guy Sutton, quoted from the *Bulletin of Associated General Contractors,* Mr. Sutton presents the salient feaures of the new rail act and describes their effect on construction:

"It will be my purpose," says Mr. Sutton, to express my views with reference to the traffic difficulties which confront the construction industry at the present time rather than review the transportation restrictions which it has suffered during the war period and since the signing of the armistice, except in so far as our more recent experience may bear upon the subject under discussion.

The railroads passed from Federal control to private operation on March 1, 1920. While this fact is universally known, yet apparently its full significance is not comprehended by the shippers, largely because the transition thus far has not been accompanied by any noticeable change or improvement in service. As a matter of fact, too much was expected by the return of the railroads to the owners.

Whatever opposition we may have to the principles of government ownership of the railroads, and with due recognition of the charge of inefficiency which has been made against many branches of the United States Railroad Administration, yet, in my opinion, it cannot be truthfully claimed that the fundamental reasons for the failure of the railroads to give adequate service during the term of Federal control was wholly the result of government operations. The chief causes for the collapse of the railroads under the stress of war conditions were, as I view them, as follows:

1. For several years previous to the war an unbalanced relation existing between transportation demands and transportation facilities, primarily because of the poor financial condition of the railroads. The exigencies of war and the after-effects thereof would not permit the building of new equipment to adjust this differential during Federal control.

2. The unified operation of the railroads was an unprecedented experience in American railroading and consequently necessitated the development of new and untried policies and methods. While the railroad owners and head officials were actually managing the railroads, yet, fearing that the properties might be retained if Federal operation were successful, naturally their viewpoint was prejudiced and consequently their efforts were not the most effective. Besides realizing that they had nothing to lose if the properties were permanently taken over by the government, the officials in charge devoted too much of their time and endeavors as the general public viewed it, to the establishment of rates and regulatory rules, which they hoped to perpetuate in the event that the properties did revert to private operation.

3. The dissatisfaction among railroad employees and the coal miners' strike were not due primarily to the fact of

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1255 KEYSTONE PHONE, RACE 614

BLUE PRINTS

government ownership, or as is frequently alleged, to political influence, but rather to the general labor unrest that pervades the world.

Permit me to make it clear that I hold no brief for government ownership of the railroads, for I am unalterably opposed to it in principle and in practice. Nor is it my desire to unduly depreciate the work of the Uinited States Railroad Administration. The point which I desire to make at this juncture is, that the mere return of the railroads to private operation will not solve the immediate problem, because the previous conditions are not materially affected or changed.

1. There has been no appreciable increase in the number of cars or locomotives, or improvement in terminal facilities during the last five years, while the physical condition of the properties including road beds and equipment is worse than it was previous to the war. We cannot expect a marked improvement in this respect for several years to come, even if the railroads, on their own initiative or through orders of the Commission in the event that funds shall be made available for such purposes, should at once direct their attention to betterments and to the providing of additional equipment.

2. It will take at least six months for railroad officials to reverse the order and adjust themselves from Federal to private operation, and while organization is being brought out of disorganization we cannot hope for the highest degree of performance. During this transition period, unless there is a change of heart, we may expect an attempt to be made to discard some of the benefits of government operation that have accrued to the shippers and retain the features that are advantageous to the railroads.

3. Although the railroad Brotherhoods have ostensibly accepted the labor provisions of the Transportation Act of 1920, yet they have not done so wholeheartedly. Either continued inefficiently, or voluntary withdrawal from service by individuals or through strike methods, may be anticipated, at least after September 1, when reduction of wages of railroad employees will be permissible. Moreover, the disagreement between the miners and the coal operators has not been definitely adjusted, so that disruption of traffic may emanate again from this source.

The foregoing observations I will characterize as the physical and operating difficulties as they now appear and which will adversely effect the members of the construction industry, as well as all other classes of shippers, for an indefinite time.

In the main, the provisions of the recently enacted legislation mark progress in dealing with the railroad problem, yet there are features of the Esch-Cummins bill which are most likely to work particularly unfavorable to the shippers of materials for construction work.

In the first place, the Act sets forth a rule for rate-making whereby the Commission is directed to provide the carriers as a whole or in groups a fair return on the aggregate value of the property involved, which for the next two years is fixed at 5½ per cent., with a possible addition of ½ per cent. While there is no actual guarantee of 5½ per cent., nor direct transfer of earnings from one road to another, yet the intent of the provisions is so unmistakable that there is no question but that the Commission will authorize, if not initiate, rates that will assure the prescribed return. However, it is believed that the 5½ per cent., or even a 6 per cent. dividend, which may be more or less according to the ratio existing between the stocks and bonds and the established valuation of the properties, will not under present financial conditions be attractive to investors and, hence, new capital will not be forthcoming to provide funds for the immediate purchase of equipment. Then, too, because of the indirect guarantee and the small possible return, the incentive for enterprising and efficient management is nullified "mildly," if not wholly.

Though it may appear inconsistent to declare that a 5½ per cent. return will not bring the necessary financial assistance to the railroads, and in the next instance make the statement that the present freight rates applying on the basic building materials are already too high, yet such is the case. For instance: As a result of General Order No. 28 the rates on sand, gravel, crushed stone, and brick were raised on the average over 50 per cent. while practically all other commodities bore an increase of 25 per cent. The only plausible reason advanced for this discrimination in rates as between commodities was the desire to discourage building work during the war, when construction work was classed as non-essential.

In order to provide for a return of 5½ per cent. to the so-called weak roads, those which are improvident because of poor location and worse management, it is a foregone conclusion that a general advance in rates will be proposed without regard to conditions of operation or service performed unless, perchance, the strong roads absorb the weak ones. It is a well-known fact that construction work was during the war, and is now being curtailed on account of the prevailing high freight rates on indispensable materials for such purposes and that a further increase will prove most disastrous to the building of houses, highways, factories, and public structures, all of which are sorely needed. Moreover, the attempt on the part of the Commission to adjust rates so that they will not yield a much greater return than 5½ per cent. to 6 per cent. on the aggregate value of the railroads will tend to make rates unstable, which will render freight charges a factor of uncertainty that must be taken into account when contractors prepare bids for proposed work. And I will say further that factors of uncertainty are very expensive items.

Thus shippers and contractors may well conclude that the prospects are not favorable for obtaining better transportation service in the near future as a result of the financial plan of the recent Act, for it will not provide funds for purchasing new equipment, or for making improvements and extensions previous to the accumulation of excess earnings. Neither will it work towards a reduction in operating expense, nor yet remove the menace of exorbitant and changeable rates.

Fair and unprejudiced distribution of cars is one of the most important problems that confronts the construction industry today. Section 402, of the new railway legislation, reads in part as follows:

"It shall be the duty of every carrier by railroad subject to this act to furnish safe and adequate car service and to establish, observe and enforce just and reasonable rules, regulations and practices with respect to car service; and every unjust and unreasonable rule, regulation and practice with respect to car service is prohibited and declared to be unlawful."

But this general provision covering car service was not sufficient for the coal operators, so class legislation was resorted to as follows:

"It shall also be the duty of every carrier by railroad 'to make just and reasonable distribution of cars for transportation of coal among coal mines served by it,' whether located up its line or lines, or customarily dependent upon it for car supply. During any period when the supply of cars available for such service does not equal the requirements of such mines it shall be the duty of the carrier to maintain and supply just and reasonable rating of such mines and to count each and every car furnished to or used by any such mine for transportation of coal against the mine. Failure or refusal so to do shall be unlawful, and in respect of every car not so counted shall be deemed a separate offense, and the carrier, receiver, or operating trustee so failing or refusing shall forfeit to the United States the sum of $100 for each offense,

(Continued on Page 590.)

Stewart, 1619 Sansom street, Philadelphia, is taking sub-bids.

The "Builders' Guide" is in its thirty-fifth year of continuous publication.

SHEETROCK

It Can't Warp—

It Stays Put

A sheet of pure gypsum rock, sheathed in a heavy protective covering, Sheetrock is the standard wall and ceiling material in unit form. It is fireproof. It cannot warp, shrink or buckle.

Sheetrock is rigid, tough and durable. It can be cut, sawed and nailed. It is quickly and inexpensively applied. It takes perfectly any form of decorative treatment.

Sheetrock jobs—new construction, additions and repairs—offer you good profits and a growing volume of highly desirable work.

Patented Reinforcement which insures extra strength in nailing, a tight-flush joint, and protection in handling.

Sheetrock comes in standard sizes: 3/8 in. thick, 32 or 48 in. wide and 6 to 10 ft. long.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Proposals

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., June 17, 1920. Sealed Proposals will be opened in this office at 3 P. M., July 15, 1920, for alterations, etc., to the United States post office and custom house at Oswego, N. Y. Drawings and specifications may be obtained from the Custodian at the building or at this office, at the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

(Continued from Page 576.)

which may be recovered in a civil action brought by the United States."

But whatever the intent, we may take it for granted that because of the fact that the method of distribution of cars for loading one particular commodity during a car shortage period is specially mentioned in the bill and a penalty attached for failure to conform, the railroad officials will play safe and see to it first that open top cars are furnished the coal mines. Inasmuch as the shippers of mineral aggregates must use the same class of equipment, you will readily understand that there is great danger the construction industry will suffer from the same discriminatory practices in the matter of distributing cars to material producers as prevailed previous to and in many instances during Federal control.

Furthermore, the Esch-Cummins Bill gives unrestricted authority to the Commission in times of an undefined emergency to suspend, with or without notice or hearing, all rules and regulations or practices with respect to car service for such time as it may determine. This provision may easily lead to orders being promulgated giving reference to the movement of certain commodities, such as coal, grain, or sugar beets with the consequence that other shipments would be curtailed. And, if we may judge by past experience, building materials will be the first to be affected by such procedure.

These I may designate as some of the traffic problems confronting the construction industry by virtue of the Transportation Act of 1920. But regardless of what may be our anticipated transportation difficulties, we must recognize that our chief traffic problem arises because of inadequate railroad equipment, with the further disadvantage that the available equipment is not proportionately distributed among the carriers.

There is no other factor, not even the labor situation, that affects adversely the progress of construction activities to a greater extent than the irregular delivery of materials. It is largely responsible for the increased cost, and consequently the postponement, of all forms of building work. Unless there is a speedy improvement in the transportation service accorded the shippers of building materials it is going to bring disaster, not only to the construction industry but to the country at large, for the people cannot continue to endure the hardships that are brought upon them because of the housing situation and the ever-increasing cost of living, due largely to the inordinate expense of distributing food products because of the condition of our highways, and to restricted production of other essential articles on account of delay in construction of factories.

Since it appears that the supply of cars and locomotives cannot be readily increased, it is incumbent upon the members of the construction industry, as a means of self-preservation, as well as a public service, to do their part in relieving the situation. For instance: The owners and public officials having charge of construction work should award contracts early in the year, so that advantage may be taken for the delivery of materials in the spring months, when the supply of both open top and box cars is usually more plentiful. Contractors should arrange for early deliveries and prompt unloading, and provide for storage at points of delivery and on the site of the job whenever practicable. Producers of materials should load promptly and to maximum capacity, trace shipments, and report to railroad operating officials any unnecessary delays in movement.

Before concluding I wish to refer to the well-known fact that under the Act to Regulate Commerce (as amended) all shippers are guaranteed the same consideration as to transportation service, regardless of locality or any particular description of traffic. This non-discriminatory feature of our railroad regulatory laws has not been annulled by the Transportation Act of 1920, unless perchance it be in interpretation and in the administration of portions of Section 402, already mentioned.

The construction industry is second only to that of agriculture in its importance to the public welfare and progress of the nation, in the amount of investment and the number engaged therein. There is no reason, therefore, why the transportation rights and privileges of the various components of this great industry should not be respected if they will but unite their efforts in gaining the same recognition for their business as have the shippers of other commodities, with whom they must contend for their proportionate share of the available railroad equipment. It is obvious, furthermore, that the Federation of Construction Industries, both as an organization and through its individual association members, should exert every reasonable effort, and show willingness to work harmoniously with the railroad officials in order to bring about the best possible transportation service under existing conditions. But if this offer to co-operate should fail then the next step will be, with a solid front, to seek redress through the Interstate Commerce Commission to the end that fairer treatment may be secured than has been given the construction industry during the period of or since the termination of the war.

INTERESTING LEGAL DECISION

THE Supreme Court of Ohio recently held that material men and workmen have a prior claim to that of a bond company when the latter completes a construction operation after failure of contractor. The decision, which reverses the finding of the lower courts, was made in connection with an Akron operation where the contractor failed to complete the work and the bonding company under the terms of its bond undertook to finish the job. The original contractor had been paid $25,000 on a $40,000 contract when the bonding company took over the work. Claims totaling about $13,000 were filed against the balance held by the owner by material men and workmen and were allowed before the bonding company's claim to the unexpended portion of the original contract.

PEP PARAGRAPHS

Pep is the soul of progress.

A man who thinks himself of little importance usually is.

Some folks spend so many nickels that they never have a dollar.

One working honey-bee is worth a whole swarm of maybe's.

All the worry in the world won't coax in enough 'cush to feed a canary.

If you want to preserve the relation of buyer and seller, don't get too personal.

Just because a man pays for your time is no reason to assume that he pays for nothing else.

The difference between a tight-wad and a nut is that you can crack a nut and make it shell out.

Whether you rise by the alarm clock does not matter; to rise to the occasion is what lands the orders.

Let the little Gold Dust Twins do your housework, but you rustle out and earn the mazuma to pay them with.

Hot air is a fine thing in its time and place, but dont shoot it' when the other fellow's already het up.

Air castles are simply air castles, unless you build them of thought, plans determination and hard work; then they become castles of granite.

(Copyright, 1920, by S. A. Chandler.)

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

THE Philadelphia Operative Builders' Association maintains that "Rentals have not kept pace with the cost of construction, therefore investors will not put their money in investment buildings until such time as the returns received from buildings are increased sufficiently to show a return on the present cost of construction. In substantiating their claims that real estate values must be based upon cost of replacement, the association argues that "the cost of constructing dwelling houses at the present time shows an average of 150 per cent. above the normal price, taking 1914 as a basis for comparison.

"We are not producing a normal supply of buildings, taking into account dwellings, hotels, apartments, office buildings, store buildings, warehouses, factories, amusemenit buildings, etc., and with the great shortage which exists at the present time it is not likely that there will be an over-supply for at least ten years, and under these conditions there can be no reduction in the cost of producing real estate.

The following are some of the items which enter into the cost and indicate clearly that real estate values must be based on the cost of replacement:

CONSTRUCTION COSTS

Labor

	1914	1920
Common Labor	$0.17½ per Hour	$0.55½ per Hour
Carpenters	.40 "	1.12½ "
Carpenters' Laborers	.20 "	.60 "
Plasterers	.50 "	1.25 "

In further support of its contention the Operative Builders' Association quotes the following extracts from *The New Price Revolution,* by Irving Fisher, Professor of Political Economy, Yale University:

It is interesting to observe that many manufacturers think that prices must come down, including the price of labor; but they are ready to demonstrate to you that their own prices cannot come down, nor can they pay lower wages. Almost everything they buy somehow costs twice as much as before the war, and their labor is twice as dear. They cannot pay their labor less if labor is to meet the increased cost of living. Now, as a matter of fact, when we investigate almost any individual one of the so-called high prices for industrial products we are likely to find that individually it is not high; that is, it is not high relatively to the rest. Our quarrel is with the general level of prices.

"The fundamental practical question confronting business men is whether the general level of prices is going to fall. In my opinion, it is not going to fall much, if at all. We are on a permanently higher price level, and the sooner the business men of the country take this view and adjust themselves to it the sooner will they save themselves and the nation from the misfortune which will come if we persist in our present false hope.

"The country's volume of money will have to be judged in terms of this new price level, not in terms of a price level that is past.

"At the present time European goods are not 'low priced.' Prices in Europe since the war began have risen more than they have in the United States.

"Business men should face the facts. To talk reverently of 1913-14 prices is to speak a dead language today. The buyers of the country, since the armistice, have made an unexampled attack upon prices through their waiting attitude, and yet price recessions have been insignificant. The reason is that we are on a new high-price level, which will be found a stubborn reality. Business men are going to find out that the clever man is not the man who waits, but the one who finds out the new price facts and acts accordingly."

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

THE Structural Service Bureau, executive offices in Philadelphia, with D. Knickerbacker Boyd as its Architectural Advisor and Structural Standardist, is a direct outgrowth of Mr. Boyd's associations with the War Industries Board in structural problems. The activities of the Bureau according, to its officers, are devoted "to creating a greater, safer and more efficient use of building materials, equipment and devices through a better understanding of their nature, manufacture and utilization.

It acts as a point of contact between the professon of Architecture and Industries allied with it. It embodies. to the fullest extent possible, the viewpoints of the designers of buildings and specifiers their construction, of the producers of raw and finished structural materials, and of the ultimate consumer, the owner.

It stands for the co-ordination of structural activities, the correlation of data relative to the building industries and for a continuation of the conservation and standardization measures so well begun during the war.

The Bureau is at the service of producers and manufacturers of building materials which are not imitations of nature's products and which, used as structural members or for exterior finishing, are not inflammable. It not only acts as advisor from the professional and technical standpoint, but co-operates in the study of production facilities, aiming to develop them still further in accordance with architectural principles and specificational requirements.

It thus renders to its clients and, through them, to other industries whose products are accessory to theirs, and to the architectural and allied professions and crafts, a type of service heretofore unobtainable.

The Staff of the Structural Service Bureau is composed of those qualified in Architecture, Engineering, Building Construction, Town and Regional Planning, Housing and Public Information.

Irrespective of consultation, reviews of informative literature, building code data and other personal services in individual cases the services of the organization include:

Visits to the sources of production, and study of manufacturing methods and details.

Recommendations for tests to definitely determine various characteristics.

The development of new uses and improvements upon old wherever possible.

The study of shapes, sizes, thicknesses, weights and space requirements.

Establishing means of identification for requisite classifications and grades.

Standardization for prevention of lost motion and wasted material and for lessening the number of patterns, types and finishes.

Preparation of basic specifications and detailed drawings for the most advantageous use and the best methods of installing each particular product.

An unusual and complete method of reference filing permits quick access to a collection of data on structural matters, the result of years of painstaking accummulation, including:

All Governmental publications, with Standard Specifications and Details of Construction from National, State and Municipal Authorities.

Building Codes and Regulations of States and all Principal Cities.

Proceedings and other publications of all Professional, Technical, Industrial and Commercial Societies or other organizations interested in Structural matters.

Everything issued, for many years past, by the producers and manufacturers of every kind of building materials.

It was Mr. Boyd's unusual experience with the U. S. Housing Corporation and the War Industries Board which led to his retention as Architectural and Structural Standardist, by some of the important building materials industries of the country. Mr. Boyd will strive through this agency to bring about the fullest cooperation between the Architects and Industries in the solution of problems affecting each through a better understanding of the nature, manufacture and application of materials and equipment.

PEP PARAGRAPHS

Thought is the best brain food.

It takes stuff to pull a bluff.

A smile is a tonic; a frown is a disease.

Pippins fall for the guys who go after them.

Train the mind how it should go and it'll proceed of its own volition.

Don't bank too much on the other fellow, for he might be banking on you.

Don't call down anyone until you first call up and make sure that they're wrong.

Success or failure is largely the small matter of keeping your gou-go a little under your income.

Put everything where it belongs; the pretty girl up in the front office, the crabbed old maid well out of sight.

A scrambled egg in a sandwich is all to the gravy, but a poor egg whose brains are scrambled is good for nothing.

Keep your desks cleared for action; dispatch business as soon as it comes in, then you'll be ready for anything that turns up.

"Aw, leave it to dat guy to go us one better!" If they're saying that about you, you aren't worrying none about the soda fountain tax.

(Copyright, 1920, by S. A. Chandler.)

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

We'll *write* your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

* * *

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

* * *

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it To be out of sight in the commercial world is to be out of mind.

* * *

People who want to buy things do not catch the seller, chloroform him and cram the orders into his pocket.

Advertising is the proper education of the public as to where the thing can be found, and therefore it is a necessity.

We are parts and particles of each other, but a little of the kindly glue of human brotherhood is needed to fasten us together. The policeman who keeps the crossing clear, and at the same time informs us as to the location of the post office and the First National Bank, no doubt is, in one sense, an economic waste. On the other hand, he is an economic necessity. He is a necessary middleman.

He relieves the congestion of traffic and granting the hypothesis that he does not misdirect us as to the location of the post office, he speeds us on our way.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

I make it a rule never to write a grouchy letter—I telephone.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

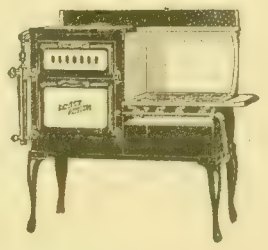
One of the many "reasons why" so many homes in and near Philadelphia are being equipped with the

Direct Action Gas Range



is that its patented oven heat regulator eliminates all guess work in cooking and enables one to obtain the same results at all times. It SAVES GAS, TIME, FOOD and WORRY!

We have it connected up with gas on our sample floor and shall be glad to have you and your clients call any time to witness a demonstration. An attractive booklet showing the entire line is yours for the asking.

As The Editor Sees It

WE believe that too much emphasis cannot be laid on the necessity for greater efforts toward fire prevention. This feeling is spreading throughout the country and the study of fire prevention has been added to the curriculum of the New York public schools by the Board of Education. The board has adopted as a basis for regular study the school manual entitled "Safeguarding the Home Against Fire," prepared for the United States Bureau of Education by the National Board of Fire Underwriters.

Emphasis will be laid in the instruction upon the fact that a fire occurs in New York City on an average of every twenty-one minutes, day and night, with "most of these due to carelessness, according to engineering experts." Many of the fires occur in homes and so many are attended by injury or loss of life that it has been estimated that about 100 persons are burned to death in Greater New York each year and many more seriously injured.

Making this study compulsory is following the example of many other communities. Kentucky has had a statute for some time making the study of fire prevention compulsory, and the last New Jersey Legislature passed a law providing for this study in September. In Minnesota it is also planned that pupils and teachers should study the subject before the close of the school year.

The National Board of Fire Underwriters through its manual, "Safeguarding America Against Fire," has recently given out some interesting data concerning fire prevention on the farm. The manual says in part:

Experience has shown that fire prevention should be universally practiced. The farmer, however, should give special attention to the elimination of fire hazards and the adoption of protective methods. This is true for several reasons. In the first place, his house, barn and outbuildings are usually constructed of combustible materials; being more or less isolated they are subject to lightning strokes; kerosene and gasoline are likely to be stored about the premises and used for light and power; he must fill his barn with hay, straw and feed which are subject to spontaneous combustion, and, last but not least, he is usually outside of the protection of a fire department. Too often a fire once started in a farm building results in a total loss, while the owner stands sadly by with his family and his neighbors, and wishes that he had taken some of the precautions which he had been considering.

In laying out a farm property, therefore, the different buildings should be well separated, so that a fire occurring in one will not mean the certain destruction of all the others. There are various features of dwelling construction, which, although costing slightly more than ordinary work, make for greater safety to life and property from fire. Among these are the use of incombustible roofing material in place of wooden shingles; provision for two stairways in different parts of the house; enclosing stairways, particularly a rear stairway that enters the kitchen, and fire-stopping between floors. All these items, with the exception of the fire-stopping, are matters that can be arranged even in long-standing structures, if the farm owner is sufficiently interested in safeguarding the lives of his family.

Among the most prolific causes of fires on farms are lightning, defective chimneys and flues, unprotected stoves and the careless handling of kerosene and gasoline.

As compared with the aggregate losses on all dwellings, the farm total represents 29% of the whole, while the number amounts to 18.1% of all residential fires.

The statistics cover only the losses reported to the National Board and do not embrace the thousands of fires upon uninsured farms or those insured with mutual companies not reporting to this organization.

As might be expected, the heaviest loss from known causes, $3,933,950, is due to *lightning* striking unrodded buildings, although experience indicates that a *properly* rodded structure is practically im-

BLUE PRINTS

mune against a harmful visitation from this element.

Defective chimneys and flues hold second place as a cause of farm fires, with aggregate losses of $1,962,031, while *sparks on roofs* stand third, with $1,181,171. The damage from *sparks on roofs* serves to accent again the property destruction due to the prevalence of wooden shingle roofs in the rural districts.

Exposure is responsible for losses of $1,111,381, but this is a result of fire, and not of primary cause.

Matches-smoking cause almost as much damage as *exposure,* the aggregate losses being $1,071,987 from 1,445 fires. *Petroleum and its products* are found to be responsible for losses of $732,067.

The seriousness of *spontaneous combustion* is indicated by the total losses during 1918 of $715,151 on farms throughout the country. The toll from *incendiarism* was $107,837.

It is noteworthy that the total losses from *electricity,* the chief cause of fire in the combined occupancies of all kinds, are comparatively unimportant on farms, amounting to only $239,063. This apparently indicates that this hazard has not yet assumed serious proportions in the agricultural districts. It is believed, however, that since the close of 1918 there has been rapid progress made in the introduction of individual electric light and power plants and that from now on this development will be reflected in rural fire losses. Electric systems when properly installed according to the National Board's Electrical Code, are the safest known means of light and power; the hazard lies in the activity of amateur electricians and the in the carelessness of the users of current and the various attachments.

The smallest reported loss, $703, is due to *steam and hot water pipes.*

It has been mentioned that damage from lightning may be readily prevented. During one Summer month, for example, there were 191 lightning fires reported in the Province of Ontario, but only two involved rodded buildings, and it is probable that they were not properly equipped. A rod that is broken or that is not correctly installed actually increases the lightning hazard.

Not only should the house, barn, silo and all other structures be rodded, but wire fences should be "grounded." Horses and cattle frequently drift along with a storm until they come to some barrier. This is likely to be a wire fence which becomes charged with electricity under certain storm conditions. If the fence in the open field is well grounded at least every ten rods, and at every corner in yards, a lightning stroke will be carried harmlessly into the ground.

To quote from the "Suggestions of the National Board of Fire Underwriters for Protection Against Lightning:"

"The ordinary condition causing a lightning discharge is a cloud charged with electricity at a greatly different potential from that of the earth. The difference of potential is finally sufficient to 'break down' the stratum of air between earth and cloud, and an electrical discharge takes place. The resistance of the air stratum being generally less betweeen cloud and tops of buildings and other structures than between cloud and earth, such high points take the discharge, and unless some less resistive path is provided from these points to the ground than the structure to be protected, the lightning will follow the next best course to earth, generally causing damage to the structure and frequently starting a fire.

"It is therefore desirable to locate the conductors forming the lightning protection so that the lightning will strike these and be carried to earth instead of tearing through the structure on its way to the ground."

This booklet also states that only two ground terminals are needed where the required number of air terminals is not more than six, but that it is good practice to provide an extra ground terminal so as to avoid "dead-ended" conductors.

Where wire fences are grounded, a rod or cable equal to three number twelve wires, or one number nine, of the same material as the fence wires, should be used to connect up each lateral wire of the fence, and it should extend at least three feet into the ground. If the ground wires are allowed to project a few inches above the fence they will prevent strokes in their vicinity in the same manner as points on a building.

Where fences are connected with a building, they should be grounded at the first post from the structure, and, in addition, the ground rod of the building should be connected with the fence.

In addition to the special hazards incident to farming, the farm has all the usual dwelling house fire dangers. Prominent among these are defective chimneys and flues with improper stovepipe connections, which stand out as the most frequent cause of interior fires. The heating and cooking plant is therefore one of the hazards that should first receive attention.

Ira H. Woolson, Consulting Engineer of the Committee on Construction of Buildings, of the National Board of Fire Underwriters, and an authority upon the subject, says, in a pamphlet upon dwelling house fire dangers: "A considerable part of the chimney hazard is due to carelessness and the balance to bad construction."

Flue holes, when not in use, should be closed with tight-fitting metal covers and never pasted over with paper. The smoke pipe, when put into place, should be provided with a ventilated metal collar having a diameter at least twelve inches larger than the pipe, which will prevent the heat of the pipe igniting adjacent woodwork. No bare smoke pipe should be within twelve inches of any woodwork, or any wooden lath and plaster partition or ceiling. A smokepipe will sometimes become red hot, especially when wood is used for fuel, and in this condition it is particularly dangerous. This is notably true where nearby woodwork contains pitch or has been painted. Many fires have occurred from this cause while the occupants of houses have been temporarily absent.

Smokepipes should never pass through floors or closets and should never enter a chimney in the attic or garret. This portion of the house is customarily a storehouse for old furniture, clothing and other combustible material and is usually lined with unprotected woodwork. If a pipe passing through this space should become overheated because of the presence of soot or any other cause, it is almost certain to start a blaze, and owing to the secluded location, the fire is likely to involve the whole attic before it is discovered.

Smokepipes, however used, should be securely held in position by means of heavy wires, and should be thoroughly cleaned at least once a year.

The flooring beneath stoves which stand upon legs should be protected by sheet metal extending forward at least twelve inches directly beneath the ash pit, and stoves resting directly upon the floor should be placed upon a foundation of either brick or cement four inches thick. The nearest wooden surface in the vicinity of stoves should be protected with sheet asbestos, iron or tin. If metal is used there should be an air space left behind it. Open fires should always be screened.

Accelerating a sluggish fire with kerosene would seem to be a practice foreign to present-day intelligence, yet it is a form of most dangerous carelessness that is indulged in with surprising frequency, as the records clearly show. A recent regrettable case concerned a four-year-old boy who was seriously burned while pouring kerosene into a stove from a cup as "he had seen his parents do." The practice cannot be too strongly condemned.

In the disposal of ashes, it is important that metal receptacles be used and not wooden barrels or boxes, since supposedly defunct coals often prove to be very much alive. Damp clothing should

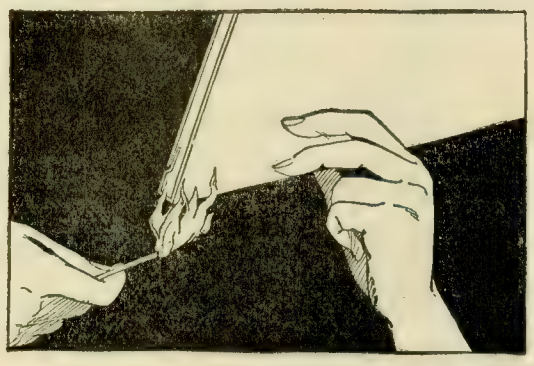
Residences (10), Oakley street, South of Princeton street, Philadelphia, $6,800. Architect, private plans. Owner, J. Charles Yundt, 301 Tabor road, Philadelphia. Brick, 2 sto-

Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.



For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

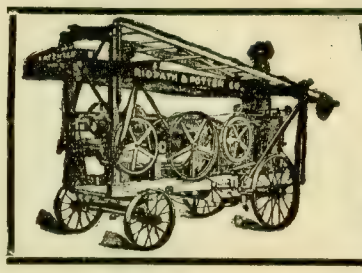
Individual Garages (31), Pastorius street, East of Germantown avenue, $19,000. Archi-



Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

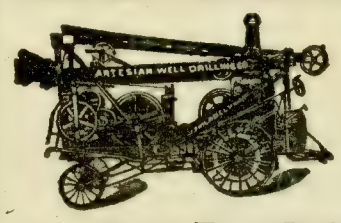
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 596.)

never be placed close to a stove to dry as it is likely to take fire.

The combination of a defective chimney and a wooden shingle roof is most dangerous. Usually, when an improperly constructed chimney develops cracks above a wooden shingle roof it is merely a matter of time before sparks escape through the openings and, dropping upon the dry, tinder-like shingles, start to burn up the house.

In addition, the wooden shingle is subject to ignition from the lighted brands of forest and prairie fires and from locomotive or other sparks that may be flying around. The metal roof, besides offering protection in this regard, also acts as a conductor of lightning if the material is properly grounded.

In New England and to some extent in the Dakotas, severe weather conditions have resulted in the practice of building the farm house, barn and carriage shed practically as a continuous structure. When such an arrangement is necessary, standard fire walls at least twelve inches thick should be erected at each division point, and especially where the house and barn adjoin. The fire walls should be parapeted at least three feet above the roof line and all wall openings should be protected by standard metal clad fire doors.

AN INDUSTRY CLEARED FOR ACTION

The Preliminary Prospectus of the Guild of Builders (London) Limited

" We are convinced that what we can see others can see, and nothing will persuade us that the world is not ready for an ideal for whihh we are ready."—A. MAUDE ROYDEN.

Issued by The National Federation of Building Trade Operatives (London District Council), 9, Rugby Chambers, Chapel Street, W. C. 1, London.

"THE MEANING OF THE GUILD"

"In industry those who work with their heads and those who work with their hands co-operate to produce the things which all of us need. If conflict and disunion take the place of co-operation, wealth production is hindered and everything the community requires is rendered less abundant and more costly. To secure this harmony of interest is the master problem of the modern industrial state."

"We stand today at the beginning of a new period of economic history. The great Trade Unions—no longer mainly defensive and restive—are awakening to a new conception of their functions; a new vision of creative service. And the Building Industry of England will be the first great staple industry to put this new conception into practical shape in the form of the Guild of Builders.

"A Guild is a self-governing democracy of organized public service. It is the very embodiment of the 'team spirit.' In its full development it means a whole industry cleared for action, with all sections united for a common purpose—with a new incentive—the organized service of the community, instead of the attainment of profits.

"It boldly challenges the industrial traditions of a century, and makes its appeal solely to the best instincts and creative impulses of men. For it is the first industrial organization in history that is set up to *give* service rather than to *get* it. Every word that Ruskin or Mazzini uttered on the claims of Duty and the joy of self-expression in free service, finds its echo here. This is the soul of the movement. It stands on a different plane from all other industrial systems, whether controlled by the State, by Municipalities, or by consumers. They are the organization of *Rights*. Guilds are the organization of *Duties*.

"THE CALL OF THE GUILD"

"It is always possible to enroll the best men on the side of the best idea."—THE VENTURE, *April,* 1920.

"Rightly planned, a Guild will be the finest piece of industrial organization that we have yet seen. It will summon to its aid the very best ability and talent that our industry can offer. Administrators, Technicians, Mechanics, Workers of every type will volunteer for its service, without thought of monetary gain; conscious that they are entering upon one of the greatest tasks in history;

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

conscious that it needs them and cannot do without them.

"The Structure of the Guild of Builders (London) Limited"

"The Trade Union Ticket is the certificate of Guild membership. Every member of every branch of the National Federation of Building Trade Operatives and of every other approved group of Building Trade Workers in the District is a Guildsman and has a vote in the election of the Guild Committee. This, in turn, will ultimately form a part of the National Guild of Builders—a great industrial combine for the public service—with full democratic control by all the workers by hand or brain engaged in that service.

"The Guild Committee"

"The Guild Committee, therefore, will consist of representatives elected by the following Trade Unions or approved groups within this District:

(*a*) The Trade Unions affiliated to the District Section of the National Federation of Building Trade Operatives.

(*b*) Any other Trade Unions or groups of Building Trade Workers within the District, whether Administrative, Technical, Clerical or Operative, that may be approved by the Committee.

Each Trade Union or approved group will elect One Member.

"When there are several Local Committees operating in the District, each of these Local Committees will be represented on the Guild Committee. In this way we shall secure an elected Executive Committee chosen by Districts and by crafts.

"The Legal Entity"

"Each of these members on election will take up a One Shilling Share in a Society registered under the Industrial and Provident Societies Acts, 1893-1913, and entitled "The Guild of Builders, (London) Ltd.' He will also deposit with his electors a signed, open transfer, thus giving them power to replace him at any time. In this way the Guild Committee becomes a legal entity with power to enter into contracts, and yet the whole of its members are under control of the industrial democracy they represent. If any Union or Group fails to elect its member by the appointed day, such member may be co-opted by the Society in General Meeting.

"Ojects of the Guild"

"The first and immediate duty of the Guild is to mobilize the necessary labor to build the houses so urgently needed by the nation, and to build them in the best possible manner and at the lowest possible cost.

"The objects, as stated in the Draft Rules, are:

1. To carry on the industry of Builders, Decorators and General Contractors.
2. To undertake all branches of supply, whether as Merchant, Manufacturer or Transporter.
3. To carry on any other work which the Society may think necessary or desirable in connection with the above objects.

"From this it will be seen that the Guild is designed ultimately to undertake every branch of the Building Industry, and to provide its customers with the services of skilled architects and engineers, to purchase and manufacture the materials, to transport them to the site, erect the buildings—and even, perhaps, to furnish them.

"Democratic Control In Practice"

"The Guild Committee will be responsible for the appointment and removal of managers, and for the fixing of their salaries. It is important to notice here the difference between the Guild practice and that of the self-governing workshops which have so often been set up without conspicuous success. The manager of a self-governing workshop is responsible to his own staff. The Guild Manager, however, is responsible—through the Guild Committee—not only to his own staff, but to the whole of the organized Building Trade Operatives in the District. This gives him security without weakening the full democratic control by the workers.

"Remuneration of Guild Committee"

"It is suggested that members should be entitled to subsistence allowances, and compensation for lost time and all expenses.

"Powers of Appointed Managers"

"Whilst it is generally agreed that large powers should be given, it is recognized that this is a matter for the Guild Committee itself to decide, and does not therefore come within the scope of this prospectus.

"The New Status of the Guild Worker"

"The labor of Guildsmen will no longer be regarded as a commodity like bricks or timber, to be purchased, or not, as required. *As soon as it can be arranged,* the Guildsman will be 'on the strength' for life. He will draw Guild pay in sickness or accident, in bad weather or in good, at work of in reserve. The minimum Guild pay will always be the full standard rate as fixed for the industry as a whole, but there is no doubt that the Guild will be able to increase the purchasing power of its members' pay by the scientific organization of production.

"Building Contracts"

"The Guild will undertake work for every type of building owner, whether public or private. It will build for agreed prices or for prime cost plus a fee. But in every contract the price for the fee must include the percentage necessary to secure, during its run, to all engaged thereon, the continuous Guild pay described in the last paragraph. Beyond this there will be a small percentage for the purchase of plant, for overhead charges, and, if necessary, for the hire of capital, at fixed rates, without powers of control.

"Organized Public Service"

"This is the watchword of the Guild. It means that its surplus earnings will under no circumstances be distributed as dividends. This is a fundamental rule. Surplus earnings will always be used for the improvement of the service, by providing for increased equipment, for reserve, for technical training and research, and for the elimination of hired capital.

"Ownership of Plant and Material"

"It is intended that all plant and material shall be transferred to the properly constituted authority to be set up in connection with the National Guild of Builders.

"Craftsmanship"

"'We shall do work worthy of the Middle Ages,' said one of the Manchester Operatives to whom the Guild owes so much, and he was right. The Guild stands for the revival of the Building Art. It will offer scope to the craftsman such as he has never dared hope for. It opens out possibilities of service to the skilled administrators and technicians that the old system could not possibly provide. And it gives them all a new status as free men, working in a democratic comradeship of service.

"Financial Guarantees"

"The Guild will give no financial guarantee for the performance of its contracts. It pledges itself to carry out the work that it undertakes, and it supports this with a roll of volunteers pledged to do the work. This is the most effective guarantee that can be devised.

"The Call for Volunteers"

"A form of enrollment will be found at the end of this prospectus, and all Building Trade Workers of every grade are invited to sign it, and at the same time to subscribe to the *Journal* of the Guild, and to the loan for preliminary expenses.

"The Journal"

"*The Guild Journal* is an essential feature of the scheme. It will keep all the

Guildsmen informed as to the progress of the movement. It will follow closely the proceedings of the Building Trades' Parliament before which the Guild proposals will be frequently debated. It will illustrate the buildings erected by the Guild, describe new methods and new processes, circulate statistics, publish correspondence, and, above all, it will be recognized and read by the public as the official organ of the New Industrial Democracy.

"WILL THE GUILD WORK?"

"'No one who has ever risen to any great height in this world has refused to move until he knows where he is going. Here is the great spiritual weakness of our time: we have lost sight of the venturesomeness of Faith. But somebody has got to break away—somebody has got to break the spell of things as they now are, if we are not to go on in a cycle of increasing tragedies. How can we go without knowing whither? How can we lose without seeing any acquisition?'"

"'If Columbus had reflected thus, he would never have weighed anchor. It is madness to sail the sea without knowing the way; to sail the sea no one has ever traversed before; to make for a country the existence of which is a question.'

"'But with this madness, he discovered a new World.'"

EDITOR'S NOTES: The Guild movement has undoubtedly been greatly stimulated by the collapse of the Government's housing program in England. "Has any Government ever collapsed so ingloriously before an urgent task?" say the *London Nation.* "Mr. Lloyd George and Mr. Asquith both see no alternative to bureaucracy except 'private enterprise,' and their specific has been tried for the housing difficulty with the results that are familiar to us all. We are now to see some experiments based on a different analysis of human nature. They will be watched by all who realize to what a plight mankind has been brought by the play of those motives which seemed to the old economists, and still seem to our rulers, the only available springs of human energy.

"The complete collapse of the Central Government before a plain and urgent task has been followed by the awakening of local consciousness and the readiness on the part of local authorities to try new departures. An industry in which chaos and complexity were conspicuous has taken steps to organize itself as a public service, and as it happens this industry is at the moment the most prominent in the public eye. To those who are looking with interest and sympathy to the new ideas of democratic thinkers about the functional organization of society, both these developments have a special significance."

The numerous building Guild developments that have sprung up all over England are all based, as in the London Guild, upon their ultimate amalgamation in the National Building Guild. The Guilds are of course still handicapped by high prices for land and materials, and lack of credit, but it is not at all unlikely, as we are advised, that an arrangement with the Co-operative Societies may go far toward removing some of these difficulties.

PEP PARAGRAPHS

Ability is largely application.

I guess so is the reply of a failure.

Many heated discussions come from hot heads.

Pep is the seasoning which gives relish to the things we do.

A grain of forethought is worth more than a ton of afterthought.

Ideas are like rivets; they should be driven home and clinched while hot.

A successful man goes to the highest authority; an unsuccessful one to the lowest.

The saddest gink we ever saw was one who hadn't discovered what he wanted to do.

It's not necessarily talk alone that puts over a proposition; it's suggestion, persuasion and determination.

You may have all the time in the world, but don't judge the importance of the other fellows' time by that of your own.

You can call a man up for a nickel, and you can call him down for nothing; but sometimes you have to pay for medical attendance.

Don't assume just because a man's working for you that he's your personal slave; in five years you might be working for him.

(Copyright, 1920, by S. A. Chandler.)

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

As The Editor Sees It

THERE are two crying needs in the country today—housing and transportation, and in neither case is there any immediate prospect that the need will be met. Inasmuch as construction is greatly dependent on transportation, building interests are much concerned with both problems. It is easy to comprehend the seriousness of the situation when we learn that the railroads have been able to move only 3 per cent. of the 1919 wheat crop since April 15. Between now and September 1 there will be available for shipment 63,000,000 bushels of wheat, and transportation facilities for about 40 per cent. of the amount to be shipped.

The recent order of the Interstate Commerce Commission, says the *American Contractor,* which places all open top cars at the disposal of the coal miners, buries most of the few straggling hopes which remained on the part of shippers of sand, gravel, lumber, brick, and other materials which are needed to erect shelter for humanity and for industry. The building industry can obtain open tops only after the full needs of the mines have been met, provided that the building materials be loaded on the return trip to the mines and that the destination is not a point beyond the mines. This provision will allow for a very minor movement of the materials needed in various sections of the United States.

Just beyond the horizon of this spectre of losing all the gondolas lies the half cousin spectre of a big boost in freight rates and the possibilities of using all the cars for moving grain. The country needs and must have coal. We admit that. No industry is going to profit by a coal famine unless it be the landlord industry, which might profit at the expense of freezing tenants. We all want to see the grain shipped. No industry is going to profit by a hungry people. But we of the construction industry want to see some brick and lumber shipped, because we feel that even with food and with fuel there is going to be ultimate suffering and unrest if shelter is not provided. There is a mismanagement somewhere or a goodly share of food, fuel, and shelter materials could be shipped. Since the railroads have gone back to private control, we must blame inefficiency upon management which does not untie the knots which tie up transportation. Any man in any community can look around and see some mighty bonehead plays being made in this transportation game. Of course, patience is a cardinal virtue up to a certain point. But when that ponit is reached where the construction industry is turned down completely by the railroads upon their open admission of failure, it is time for every last man in the building game to open his eyes to see what is wrong, and seeing what is, to yell so loudly that the Interstate Commerce Commission and all other commissions wake to the fact that if every gondola in the United States were used to full capacity under effective management, even with present equipment, there might be shipped not only the coal, but other materials as well. Obviously this can not be done when the lackadaisical operation now in vogue as a result of switchmen's strikes and other factors which deter railroad operations. The construction industry has labor troubles enough of its own to know just how hard they are to solve, but in spite of them, the building game has not gone completely upon the rocks. Why not? Simply because more and more real initiative has been used in getting somewhere. What is very necessary now to the survival of industry is the taking of the kinks out of the railroads of the United States and when rates are raised the construction industry with its large freight bill must be eternally vigilant to see to its just rights.

* * *

IT IS evident that homes cannot be built without materials, yet it is imperative that homes be built. In order to meet the great deficiency in homes, construction must go ahead, not only with speed but with the utmost efficiency in methods of production. An interesting view of quantity house production, held by W. J. Parsons, president of the W. J. Parsons Housing Company

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.
1209 Arch Street, Philadelphia
BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

of Chicago, comes to us through the *American Contractor,* which quotes:

"The chief merit of building houses in quantity is the *low price,* and money talks these days louder than ever. Another merit is the speed with which fifty, one hundred, or more, houses can be built when handled as one job by a large contractor. We can never catch up in home building by individual building. It is going to require *every* small and *every* large contractor to build to his limit for two to four years in order to wipe out the big shortage of homes. There is plenty of work for us all.

The building of many new industrial plants in the outskirts of our towns requires the building of large numbers of houses all at once for the employees of these plants. Individual house building will not meet the situation at all. The houses must be built by the hundreds and as quickly as possible. The financing of such projects is better and easier handled by one agency. It is clearly a wholesale proposition.

A great many of the large housing projects of the past have lacked character and beauty, but in the last four of five years there have been architectural treatments of both the houses and the villages which are very commendable. No housing projects nowadays, not even for coal mining or steel companies, have all their houses alike. They specify that no two houses in the same block will look alike and they insist upon it. The architects of the country are studying group housing and more and are producing fine results, and so we must not bewail the lack of character and beauty in quantity built houses any more.

It is all right for each one of us to want an individual house. It would be *fine* if we could build our own ideal home, but unfortunately most of us cannot afford to do it. The high cost of an individual home is too much and it is better for some of us to own a house just like our neighbor's than to live four deep in high-rental, cell-like apartments. It will be better for our children, ourselves and our pocketbooks."

* * *

THIS probblem is most interestingly discussed by Emile G. Perrot, of Ballenger & Perrot, New York and Philadelphia, in *General Fireproofing,* under the title Industrial Housing, and we print the article in full on another page.

POUR YOUR OWN HOME.

B. L. T. waggishly suggests in *The Minneapolis Journal* that "Pour Your Own Home" would be an excellent slogan for the builders of concrete habitations.

NEED OF STANDARDIZATION IN BUILDING.

Conditions during and since the war have brought home to everyone the necessity of maintaining production with less labor. Manufacturers have realized this, and have sought all possible means for securing greater efficiency.

The most effective means of increasing production and the basic cause of America's industrial growth is standardization. Elimination of duplications in products and parts has reduced the number of manufacturing operations and effected savings in time and labor.

Comparisons show how hopelessly inadequate the old methods would be under modern conditions. Compare the book of today, turned out by thousands on a modern printing press, each one exactly alike, with the methods of a few centuries ago when each book had to be laboriously written by hand. Every manufacturing industry presents illustrations just as striking.

In the building field, only initial progress has been made in standardization. In some lines such as steel sash a fair degree of standardization has been reached, but building in general still remains a strictly made-to-order proposition. Even in bricks, whose history dates back to the Pharoahs, one will hardly find two manufacturers making the same size.

The cause of the lack of standardization in the building field is largely a matter of evolution. Building being one of the oldest industries has developed processes and methods which have become traditional. In former times, it was simple and logical to build as one went along and to meet any indiivdual requirement. Labor and material were plentiful and inexpensive, and needs were not urgent. Modern times, and particularly the present day, will not permit of such methods if volume and economy of construction are to be obtained.

The greatest building need of the time is standardization. This means the elimination of hundreds of duplicate products which exist only out of traditional habit or personal whims. An instance of the adoption of standardized methods is the action of a number of reinforcing steel companies in eliminating half the duplicate bar sizes—an action which increases production of the rolling mills and makes available largel local stocks. Similar standardization is sure to take place throughout building.

Some critic of the foregoing may ask—"Are you not making all your buildings exactly alike, each one a monotonous repetition of the other? Are you going to eliminate all individuality and art from our structures?" By all means, no! The standardization of the units of construction does not affect in any way the combinations of these units. Designers have always built with units that were repetitions of one another. Bricks in a building are all one size, yet the arrangement of these bricks makes possible any desired effect, depending upon the skill of the designer. Standardization will not limit the designer, but will do away with a great part of waste now required by our hand-made methods.

Construction operations in the field must adopt more of the factory methods so that the skilled workman can make his time most effective. Many operations in building date back for centuries, so our erection forces should be able to profit materially by the study of American industry.—*Modern Building.*

HAPHAZARD CONSTRUCTION OF HOMES.

A prominent Ohio citizen was not especially enthusiastic about a building ordinance for the city, reports the National Lumber Manufacturers' Association, until he inspected recently the construction of 32 houses out of a total of 42 now under erection in the town. The local dealer who is erecting these houses has violated nearly every possible law of good building. The foundations to grade are concrete poured dry and are cracked. From grade to sill cement blocks are set together without even a pretense of mortar in joints. He fills the joints inside and out after the building is up. The posts in the basement are misplaced. The spiked bearing member in his floor was in the way of a furnace pipe, so he cut into the member and laid a short run pipe against the bearing member without any insulation. If the register above is shut off with a hot fire going and possibly children sleeping in the house, it would not take an expert to forecast the probable result. If a joist interfered with placing a register box, he would cut out the joist and use two by four headers spiked in. The woodwork was spiked to the flue—this alone being sufficient to condemn the structure so far as fire safety is concerned.

Even a novice in building laws can see the fire hazard in such houses and the urgent need of city building regulations which would not permit such careless construction. And yet if such a dwelling should be burned, many would thoughtlessly lay the old-time blame upon frame construction or shingle roofs, whereas the fault should be absolutely credited to the violation of almost every law of building known to the profession.

Residence (Alts.), Prospect and Summit avenues, Chestnut Hill, Philadelphia. Architect, Herbert J. Wetherill, 430 Allen Lane, Chestnut Hill. Owner, Frederick M. Dunn,

Barrett Specification Roofs

Bonded for 20 and 10 Years

Why we dare give a Surety Bond—

FOR many years we have backed up our belief in Barrett Specification Roofs with a Surety Bond guaranteeing these roofs to be free from repair or maintenance expense for at least 20 years. We are often asked how we *dare* give such a Bond.

The explanation is simple. We know from 60 years' experience that roofs made with Barrett materials and built according to the detailed directions of The Barrett Specification will greatly outlast the 20-Year guarantee.

We do not lay roofs ourselves. That is always done by a roofing contractor. We have therefore, no motive for cheapening the job or passing as satisfactory any faulty construction. On the contrary, it is to our interest to see that every bit of material is of the grade specified, that all of it is used, and that it is used properly.

Furthermore, there can be no temptation for us to permit the construction of a roof that will give *just* the 20 years of guaranteed service, for we must have a liberal margin of safety beyond that 20 years.

This means that we are going to see to it that you, as a building owner, get all that you pay for—not only for *your* protection, but for our own as well.

Barrett Inspectors watch every Bonded Barrett Specification Roof during construction to see that the specified materials are used and that they are properly applied.

As a further precaution, after the roof is laid, and before the final surfacing of gravel or slag is added, a Barrett Inspector makes an Inspection Cut for every 25 squares of roof area, as shown by photographs at bottom.

After the cut sections have been replaced and covered by an equal number of layers of pitch and felt, the final surfacing is applied to the whole roof—75 pounds of pitch covered with a protecting layer of 400 pounds of gravel or slag to every 100 square feet.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can point to many roofs of this type that have been in service over forty years and are still in good condition.

For those who wish a somewhat lighter and lower priced roof-covering, we recommend the Barrett Specification Type "A" Roof bonded for 10 years.

Both roofs are built of the same high-grade waterproofing materials, the only difference being in the quantity used.

The Surety Bond is offered on all Barrett Specification Roofs of 50 squares or over in all towns of 25,000 population or more, and in smaller places where our Inspection Service is available. This Surety Bond is issued by the U. S. Fidelity & Guaranty Co., of Baltimore, one of the largest surety companies in America.

Our only stipulations are that The Barrett Specification *revised April 15, 1920,* shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

Full details regarding these Bonded Roofs and copies of The Barrett Specification free on request.

Photograph shows the first step of the test cut, to which every Barrett Specification Roof guaranteed by us is subjected.

Note the thickness of this heavy, waterproof blanket. After the piece of roofing has been replaced and the cut covered by an equal amount of material, 75 lbs. of pitch, a protecting layer of 400 pounds of gravel or slag is applied to each 100 square feet.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

INDUSTRIAL HOUSING

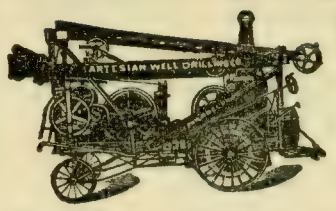
By Emil G. Perrot.
Member Am. Soc. C. E.
Of Ballinger & Perrot, New York and Philadelphia.

"Princes and lords may flourish or may fade;
A breath can make them, as a breath has made;
But a bold peasantry, their country's pride,
When once destroyed, can never be supplied."

—*Goldsmith.*

The most important part of an industrial operation is the human part—the men and women who run it. Machines are important. Factory buildings are important. But they are also useless without the men and women; whereas men and women could, in a pinch, make progress without either the machines or factories, as was the case before the invention of machinery.

Yet, although this supreme importance of the delicate human equation is pretty generally admitted theoretically, it has been almost totally ignored in practice.



Plans for factory buildings receive the most painstaking care; factory machines are solicitously nursed so that their production will constantly punch the maximum notch; but factory workers are left to shift for themselves after working hours. Can any one conceive a captain of industry permitting his costly machines to be sheltered in any old fashion after working hours? Can any one picture him withdrawing all thought and guard from his factory after the lights are out? But it requires no stretch of the imagination to fancy this same captain totally oblivious to the welfare of his industrial aids, after the day's work is over.

If we grant that the need of the hour is accelerated production, and that accelerated production is dependent not only on the number of workmen, but on the character of workmen, we must of necessity admit that the housing of the workmen is of prime importance.

Disraeli says that the house is one of the most important factors in shaping the true growth of the individual. Ramshackle dwellings cannot fail to impress their character upon their inmates, and ramshackle workers cannot fail to im-

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

press their character upon their work.

Industrial housing is more than a mere question of providing some sort of shelter for employees. If this were the only consideration involved, a row of barracks or barns hastily erected at a trifling expense would make everything serene. Unfortunately, or rather fortunately, the question is not merely how to keep the rain on the roof, or the four winds on the outside of walls, but how to provide houses that will develop the best traits ingrained in every human soul. Houses cannot do it all, but houses can do a lot.

Heretofore the demand for houses has been supplied by the speculative builder and the real estate operator, but owing to the present abnormal prices of labor and building materials, they can no longer afford to build and sell at a profit in the open market. Nor can any definite rental returns be counted upon under the present precarious and changing conditions; while, at the same time, the demand for better houses is continually increasing, the supply is almost at a standstill. Then, again, owing to the offer of more remunerative investments in the industrial centers, the speculative builder has great difficulty in securing construction loans to finance housing projects. Speculative capital always flows into those enterprises which offer the largest and safest returns.

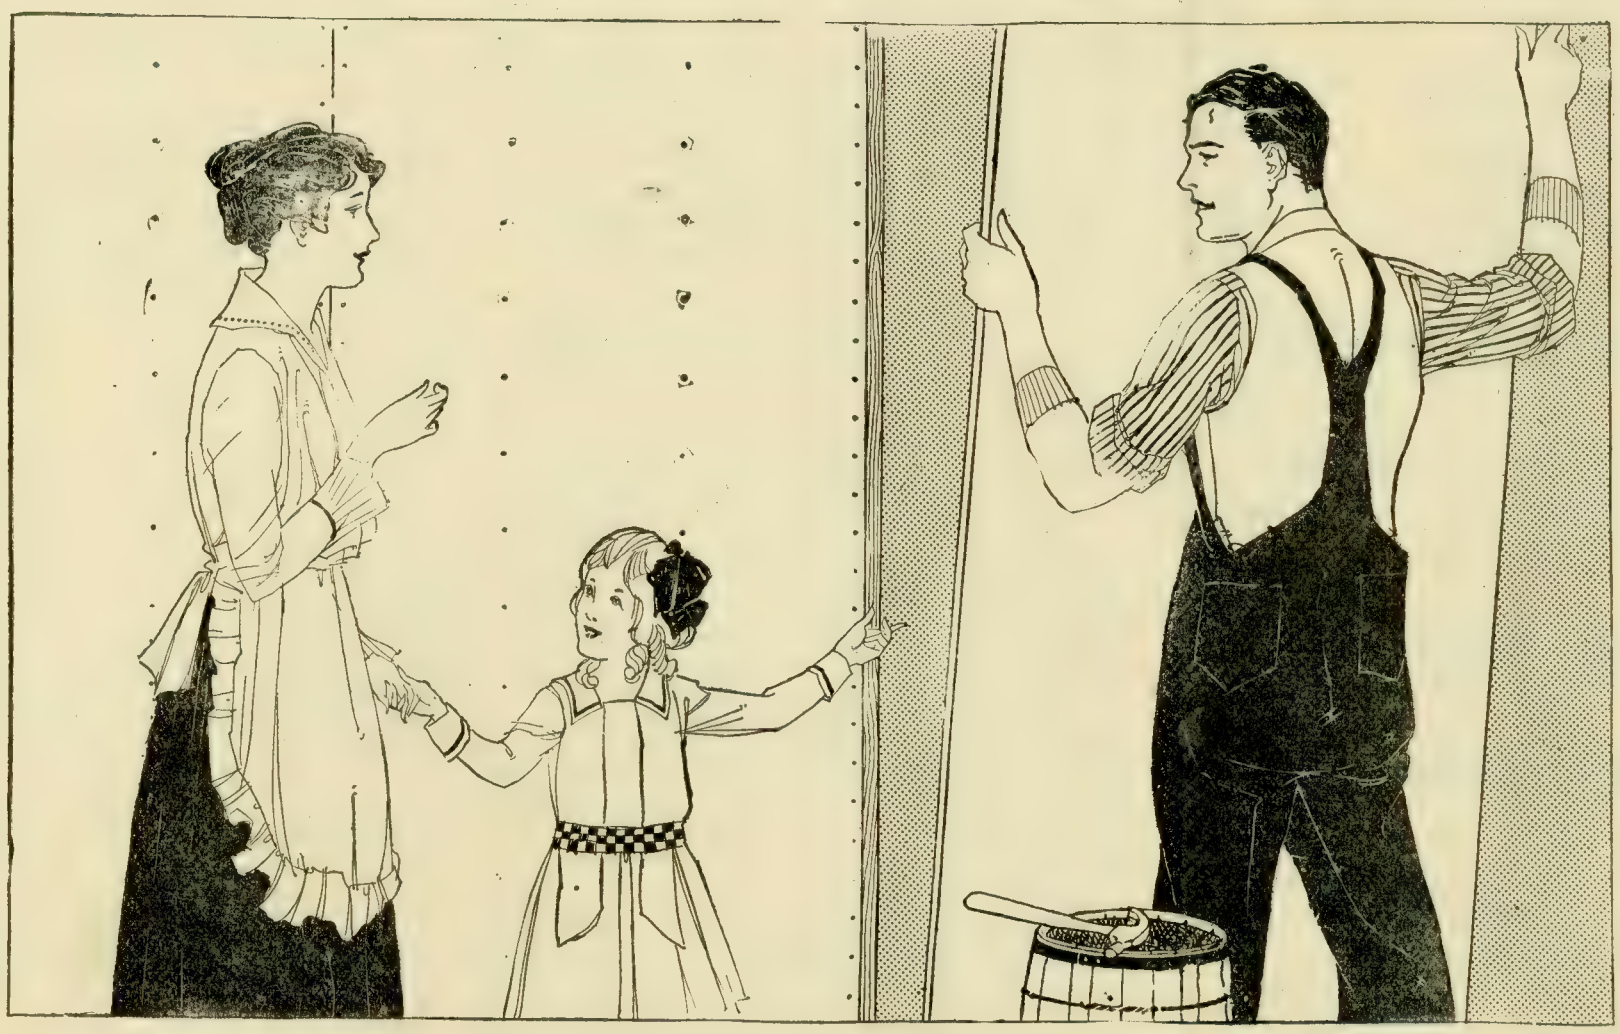
So long as congestion is tolerated, low housing standards permitted and the cost of labor and material is low, sufficient capital to maintain these low standards can be obtained by speculative builders. With the better education of the workmen and their constantly increasing demand for better surroundings, there follows a gradual diminution of profit and consequent withdrawal of capital for this purpose. The manufacturer is confronted with the certainty that industrial housing, to meet his needs, will not be financed by local investors as in former years.

And in industrial housing, the speculative builder only considers the matter of profit, and for that reason cannot have the proper viewpoint. *Industrial housing salvation lies in the laps of industrial captains.*

The evil influence of unsanitary houses cannot be underestimated. Statistics computed in various cities all prove conclusively that tuberculosis and other contagious diseases, crime, and the social evil are most prevalent in those areas having the maximum density of population. Statisticians estimate that the wage earners in the State of New York undergo an annual loss of twenty million working days a year on account of sickness. This is equal to the complete effort of more than 66,000 workers on the basis of 300 working days per year.

Proper care of infants cannot be secured in dwellings where housing evils exist. Sufficient room, conveniences which minimize the mother's household labors, well-constructed buildings which insure freedom from dampness and drafts, adequate toilets, provision for the admission of sufficient sunshine—all of these react to the welfare of the infant and the mother, upon whom the infant depends for care.

A recent report on infant mortality shows a steady increase of infant deaths in proportion to the increased number of families residing in one dwelling, or tenement. In the 1-tenement (one family) dwelling it was 88; in the 4-tenement, it was 174. The infant mortality rate for infants living in alley or rear houses was 172, while for those living in houses with street frontages, it was 120.6.



Newsholme takes as a standard that a house is overcrowded when the number of occupants exceeds double the number of rooms in the house. According to this measure the congestion in 4-room apartments was greater than in any other, in some cases in both native and foreign-born groups as many as 11 persons lived in 4 rooms. Room congestion was much more common among the foreign-born than among the native, 6.2% of the former and 1.3% of the latter living in dwellings where the occupants exceed twice the number of rooms.

Owning the home indicates an economic status well above the poverty line, and the infant mortality rate for the babies of both native and foreign-born mothers who owned their homes was significant. For the latter group the infant mortality rate decreased as the rental increased for both native and foreign-born. The foreign-born paid much lower rentals than the native born, an excellent indication that the accommodations they secured were much less desirable. A high infant mortality rate was co-existent with living in houses on the rear of the lot or facing the alley, with overcrowding within the apartment and with low rentals.

These figures are indeed eloquent. What's bad for the babies, is bad for the grown-ups. Workmen living in overcrowded, unhygienic and unsanitary houses cause the manufacturer economic loss through their impaired efficiency. If not overtaken by positive sickness, they become slow, sluggish and stupid. Filthy open privies or cesspools in the rear yards contaminating the air and soil, disseminating poison through the agency of

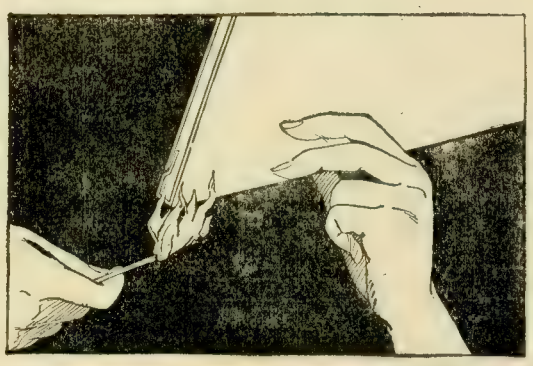
Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.



For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

7112 GERMANTOWN AVE.

flies, provide the most startling conditions for the spread of typhoid and malarial fevers. Overcrowding and lack of facilities for personal cleanliness encourage the prevalence of these diseases to the utmost. In the moral aspect, slum conditions develop in which crime and vice go hand-in-hand.

In constantly increasing numbers, good workmen today are refusing to live under these conditions. If one manufacturer will not provide suitable living facilities, they will seek one who will. The day is coming when the manufacturer will have to compete not only in wages but in living accommodations. The large labor turnover due to shifting population, resulting in the so-called "floater," is directly due to inadequate unsanitary housing. In one instance which comes to mind the labor turnover is as high as 400%. What if a manufacturer had an executive turnover of 400%? He would soon get adequate houses, or retire from business.

This refusal of the workmen to permit their families to live in dirty, damp and ill-ventilated houses or flats, exposed to all manner of disease and crime, is already bearing fruit. Model villages are beginning to spring up in industrial centers, as one manufacturer after another is brought to a realization of the absolute necessity of such ventures.

The provision of sanitary homes for workers may be accomplished in various ways:

1—By investment for industrial housing as part of the general plant investment.

2—By combining with other employers of labor to raise the necessary capital.

3—Separate corporations, with separate directors, to conduct real estate and building operations.

The governing factors in any industrial housing project are:

1—The factory location, where in a city, town or rural community.

2—The type and number of workmen to be housed and whether skilled or unskilled.

3—Financing.

Many manufacturers today, owing to restrictive urban legislation, are seeking the suburban and rural communities.

This results in two types of industrial communities, first the suburban within easy access of the shopping and amusement districts of cities and towns; and secondly, the rural located at a distance from these conveniences and under the necessity of providing them. In the suburban developments, one very important factor is that of transportation, which must be speedy, regular and cheap.

A careful study of the classes of workmen to be housed should be made, and provisions made for each class. The number of unattached single men, married couples with and without children, size of families, birth rate, death rate, sickness, infant mortality, wages earned by the workmen, habits, environment are all weighty factors which cannot be ignored in a successful industrial housing operation. They decide the size, type and number of houses.

The question of financing has already been considered.

The difference in cost between permanent and temporary construction is so small, after taking into account the necessary expenditures for water supply, drainage and road work, that it is poor economy to throw away any money upon makeshift expedients. The day of the temporary home is fled. The advent of a new concrete frame and stucco system—an entirely new idea in concrete construction, sounds the knell of the wooden frame house.

Thanks to this invention, concrete homes may now compare most favorably in cost with ordinary wooden houses; two houses may be built as economically as two hundred; a different style of architecture may be employed in each house if desired. Expensive forms, the bugbear of past housing operations, may be entirely eliminated and fire-resisting, permanent homes, needing neither paint nor repairs, erected.

Not one solitary reason for a temporary home exists today.

Cement stucco on metal lath over reinforced concrete frame, produces a wall construction which is not only rigid and permanent, but possesses the insulating qualities so essential in exterior wall work by having dead air space, thereby keeping the building warm in winter and cool in summer.—*General Fireproofing*

SEWAGE DISPOSAL PROBLEM OF A LARGE CITY.

Plans for Solving It in Philadelphia

Probably the largest per cent. of the interested citizen class in the discussion of municipal improvements is comprised of engineers in general, those employed by the city, and property owners whose estates will be enhanced by the operations involved.

The above statements are not made in a derogatory manner, as the reasons for the lack of interest in this question are apparent. Persons spending all their lives in a city where sewage facilities have always been at hand have become so accustomed to the excellent conditions that prevail that they give the matter very little consideration. To really appreciate the interdependence of the prompt removal of the liquid wastes of a community and the health and comfort of the people, however, we need only look back at the conditions existing three quarters of a century ago.

In Great Britain, about 1810, there was a gradual movement from the country to the town. This resulted in very crowded conditions. A large per cent. of the town population lived in cellars, and had no place of deposit for their refuse matter and liquid wastes. The richer classes

**Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO.,
Tasker Street Wharf, Delaware River, Philadelphia.**

were probably no better off in this respect. They had open well cesspools, but these were merely a concentration of the nuisance. As the town grew, the cesspools were covered and served as foundations for dwellings. Even the palaces of the nobility were frequently built over one or more of them. In the towns where cesspools were not available, the highways were used as a place of deposit for the foulest wastes. The gutters were often disgustingly dirty and dangerous. These conditions did not result from the lack of underground drains, as there were numerous drains to carry off the rain water, but as the drains were not designed to allow of cleaning, it was a punishable offense to put anything in them that might clog them.

The terrible Black Plague visited the islands about this time, and so aroused the people to the unsanitary conditions that the above-mentioned penalty was removed, and everything was put into these drains. They were poorly constructed, not water tight, and in consequence they became merely elongated cesspools. They conveyed enough sewage to the streams, however, to cause serious pollution of the same. This forced on the public officials the question of some manner of sewage disposal. The laws resulting were the primary steps in the development of the principles of sewage disposal.

America did not have such crowded conditions, and had numerous streams to carry away the sewage, so the question did not really become pressing until quite recently.

Philadelphia, even at that time, had given due attention to the matter of sewers. Prior to the consolidation of the boroughs and townships in 1854, it had 18 miles of main sewers and 19½ miles of branch sewers. At present, it has about 1300 miles of sewers, which cost approximately thirty-five million dollars.

This is a well-constructed system and conveys the sewage from our homes, offices and factories, but the volume of this sewage has become so great that we are confronted with the very important question, "What shall we do with the sewage?" Heretofore this has been answered by emptying the sewage into the many streams that Philadelphia has been blessed with. This is not a slipshod way, but is a recognized scientific method of sewage disposal. Nature has provided in natural streams everything necessary to effect the ultimate purification of the decomposable constituents of the sewage in an inoffensive manner. This method has its limitations, however. When this purification requires more oxygen than the water can supply, pollution to the point of offensiveness results. Another objection to this method is that the floating matter, consisting of such unthinkable materials as match sticks, tin cans, dead animals, clothing, house furnishings, etc., are not taken care of, and the natural result is unsightly waterways.

The State authorities, realizing these limitations and knowing that the State's water supply comes from the streams, passed an act in 1905, empowering the commission of the State Department to control the discharge of sewage into the waters of the State. So, in April, 1907, when Philadelphia asked for a permit for an extension of sewers, it was granted with the condition that comprehensive plans for the collection and disposal of the sewage of Philadelphia would be submitted prior to 1912.

The city previously had appreciated the need of protection to its water supply, as is evidenced by the fact that in 1883 an intercepting sewer along the east bank of the Schuylkill River had been built from tide water below Fairmount dam to approximately the northern boundary of the city, with a main branch extending north along the Wissahickon Creek.

This not only protected the water supply, which, at that time, came entirely from the Schuylkill River, but kept that part of the river clean and beautiful.

The second intercepting sewer was built along the east bank of Cobb's Creek, from tide water to the county line.

In 1900 the Bureau of Surveys built a testing station where experiments on methods of sewage disposal were to be conducted.

This station is located in Fairmount Park, adjacent to the Spring Garden Pumping Station. Valuable data was obtained on various phases of sewage disposal, such as fine coarse screens, tanks, filters, underdraining, action of germicides and disposal of sludge, etc. This data is published in the 1911 report.

The next work of this nature was the design and construction of the Pennypack Creek Sewage Disposal Works.

Pennypack Creek enters the Delaware River about 2000 feet from the intake of the Torresdale Water Filters, which now supply about three-fifths of Philadelphia with water. The sewage from the three municipal institutions and the district of Holmesburg discharged into the creek, causing serious pollution. This reached the intake by the tidal action of the Delaware River. To prevent this pollution from contaminating the water supply, collectors were built along the creek, and they conveyed the sewage to a pumping station and then to the works for treatment.

The sewage is passed through two Emscher tanks to remove the settleable matter. The liquid from the tanks then passes on to the filters, the flow into the filters being controlled automatically by a constant head operating house. The effluent, or liquid matter, flows through the filters and passes a dosing tank, where hypochloride of calcium is added to it to act as a germicide. It then passes to a final settling basin where sludge, which has been discharged from the tanks, is intercepted and removed. Then it is discharged into the stream as pure, if not purer, than the natural stream water. The plant is efficient and is not objectionable to the eye, and only on rare occasions is it offensive to the sense of smell.

This practically brings us up to the present plan now being designed in detail, with parts of it already under construction.

All phases of the problem have been worked out in sufficient detail to estimate the location of interceptors and the type of works. If enough money was available, it would be possible to complete the entire plan. The money is not available, however, so it has been planned to execute the operations in such a manner that the available funds will be utilized to the best advantage.

It has been recommended to divide the city into three parts: first, the part northeast of a line beginning at the Delaware River at Port Richmond and extending to and along the Wissahickon Creek, to be known as the Northeast Division; second, the watershed of the Schuylkill, southwest of the Wissahickon and northeast of Cobb's Creek, and that part of the Delaware watershed having sewer outlets between Port Richmond and Market Street, to be known as the Southwest Division; third, that part of the city included in the Delaware River watershed between Market Street and the Philadelphia Navy Yard, to be known as the Southeast Division.

The Northeast Division protects the Delaware River within the tidal range of the Torresdale Filters. In 1950, these works will treat sewage from 1,100,000 people, amounting to 208,000,000 gallons per day. The treatment will be practically the same as that at Pennypack, except that it will be on a much larger scale. The sludge will be placed on drying beds and probably buried.

The Southeast Division will only need sufficient ground for a pumping station and screens. The effluent will be discharged into the channel through a submerged outlet. With all other sewage being thoroughly treated, it is assumed that this quantity will not be sufficient to overtax the resources of the Delaware River, and can be disposed of inoffensively by dilution. If the future shows that this treatment is inadequate, tanks will be installed. These works will receive in 1950 sewage from 390,000 people, amounting to 82,000,000 gallons per day.

The Southwest works will be constructed in the Fortieth Ward. The treatment will be practically as in the Northeast works. These works will treat, in 1950, sewage from 1,663,000 persons, amounting to 417,000,000 gallons per day.

The above plans have been subdivided so that the work will proceed in such a way that the maximum good will be accomplished with the minimum expenditure of time and available money.

The first actual construction is the Frankford Creek High Level Collector. The name, High Level, comes from the fact that it will convey the sewage into the works directly by gravity, advantage being taken of the natural elevation of the territory. This will cleanse the Frankford Creek, which is at present in a very polluted condition, and will remove from our water supply one of the greatest sources of pollution. Part of this work is already under contract.

The works, when completed, will treat sewage from more than three million people, amounting to approximately 700,000,000 gallons per day. In order to get a conception of this tremendous volume, imagine a tank as wide as Broad Street and 100 feet high, extending from City Hall to Columbia Avenue, filled with water, and you will realize the amount of sewage that will be treated daily and sent into our streams purer than the water already in them. To be able to do this, a total expenditure of approximately thirty-five million dollars will be needed. The plan will not always be a source of expense. In fact, there are many interesting economic phases of the problem to be considered. For instance, the water supply will be protected; therefore, less should have to be spent in assuring a good water supply. Property values will be increased and much undeveloped land reclaimed, since the natural streams will not be a source of nuisance, but a source of beauty and pleasure. The port will be helped in its development by the removal of the filth from the docks, and we will not be constantly refilling our channel with refuse matter, etc.

The project is no longer a pleasant dream, but is fast becoming a reality. It is one of the most comprehensive problems of its kind in our country today.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

PEP PARAGRAPHS

A mob is a headless gathering.

Cents and nonsense seldom go together.

You can't drive a mule, but you can lead it.

In order to extend your credit, pay promptly.

A cinch is something which you have already mastered.

Find out what you wanta do, then sail in with both feet.

Enthusiasm is the boy who lubricates the wheels of progress.

It requires nerve, determination and foresight to blaze a trail.

It frequently takes sadness to teach us to appreciate gladness.

Mosquitoes aren't very large or important looking, but they sure let us know they're here.

"Nothing succeeds like success." Nothing fails so completely as a man who starts out believing himself a failure.

Pennies make dollars, but many a poor, misguided dub has failed for no other reason than because he learned to think only in penny denominations.

(Copyright, 1920, by S. A. Chandler.)

As an indication of the tendency toward a better understanding and closer co-operation between engineers and architects, it is of interest to note that D. Knickerbacker Boyd, architect and structural standardist, a member of the firm of Boyd, Abel & Gugert, architects, and a former secretary and vice-president of the American Institute of Architects, has recently been elected as a member for three years of the Board of Directors of the Engineers' Club of Philadelphia, taking office July 1st.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Many a man would do a better job if he didn't know about putty.—**Ex.**

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

"Camouflage" doesn't pay in advertising. Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

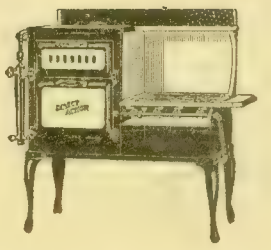
DIRECT ACTION Gas Ranges



Save Gas

Save Time

Save Food

Save Worry

besides adding to the beauty of the kitchen. Positively "the best" gas range on the market, because the oven heat regulator enables the operator to obtain the same results at all times. We have equipped large operations with the DIRECT ACTION, besides furnishing many hundreds for individual homes. A booklet telling how "wifey" can go out and enjoy the beautiful afternoon—"hubby" doesn't have to worry about dinner, it will be ready when he arrives—is yours for the asking, or better still, see the range demonstrated in our showrooms.

No More Ashes To Lug

No clumsy pan to spill dust and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just beneath the grate and connected by a sheet iron pipe straight down through the kitchen floor to ash barrel in cellar. No part is in sight. Not a particle of dust can escape. Just slide the damper once each day and drop the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new Glenwood Idea and is very ingenious. This is only one of the splendid improvements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy nickel, "The Mission Style" Glenwood. Every essential refined and improved upon. This Range can be had with the latest and most improved Elevated or End Gas Range attachments. It can be furnished with fire box at either right or left of oven as ordered. Our handsome booklet tells all about it.

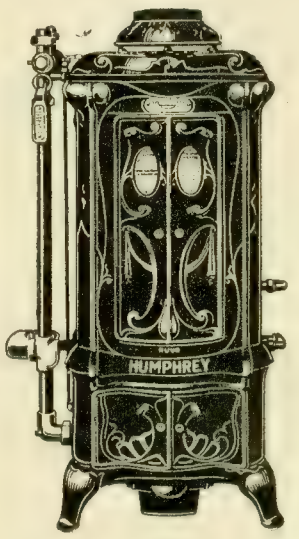
A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.



A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintaims an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

As The Editor Sees It

THE semi-annual report of building operations in Philadelphia for the first six months of this year, published in full on another page of thisissue, emphasizes again the great and increasing shortage in houses prevailing throughout the country. The six months period ending June 30, 1920, shows a decrease in total new buildings of 1589 over the first six months of 1919. In total operations consisting of new buildings, additions, alterations and repairs, a decrease of 473. Total new buildings in first six months of 1919 was $17,305,960 and in 1920 was $25,839,490, an increase in cost however of $8,538,530. In 1919 the first six months of total operations consisting of new buildings, additions, alterations and repairs was $21,567,565 compared to $38,139,120 for the first six months of 1920 manifesting an increase in cost of $16,571,555.

The greatest decrease in operations was in two-story dwellings, a drop of 1568 in the six months period and a difference in amount of $4,355,150. Likewise the three story dwellings showed a decrease in operations of 91 and a difference in cost, but an increase, of $640,035.

The notable increases are in additions made to old properties and alterations and repairs. Additions in the first six months of 1920 show an increase over the corresponding period of 1919 of 230 costing $6,162,540 more than the same kind of work in 1919. The alterations and repairs in 1920 for the half year just ended were 886 greater than in 1919 at an increased cost of $1,875,485.

The report makes clear that new buildings were greater every month for the first four months of 1920 than in 1919, but very marked declines occur in May and June. Material increases continued every month in 1920 in additions, alterations and repairs.

These alarming figures clearly demonstrate that the tendency is to increase the comfort and capacity of old buildings and to delay new operation.

Factories and warehouses in 1920 up to July 1 were greatly higher than in 1919. 48 factories costing $4,027,600 in 1920 as against 27 costing $1,004,500 in 1919. Warehouses, the number is about the same, but there is an enormous increase in total expenditure, in 1919, 16 were built, costing $398,000, and in 1920, 15 costing $4,182,000.

These conditions are not confined to Philadelphia but exist throughout the country. The situation is becoming more serious daily and says the *National Builder*:

The promise of an immense building activity that marked the beginning of the year faded rapidly in May. Building has slumped heavily, but the need for buildings of all kinds is accumulating. The potential wealth is here awaiting the adjustment of the machinery to give it movement into the right channels. In efforts toward adjustment hope rests in the activities of the National Federation of Construction Industries in conference with the Senate Special Committee on Reconstruction and Production.

While housing activity has largely come to a halt, it is obvious that the pressure of high cost while preventing building is also stirring investigation of every description of material and every character of construction and methods that holds a promise of sound economical building and financing.

The National Federation of Construction Industries in this crisis asks all building associations to furnish the Hon. Wm. M. Calder, chairman of the Senate Special Committee of Reconstruction and Production, Senate Office Building, Washington, D. C., with the following information:

1. The name and address of your President.
2. The names, addresses and committees of your Committee Chairman.
3. The names and addresses of members of a special committee appointed by your association to deal with the Senate Special Committee.
4. Information as to the shortage of housing and industrial construction.
5. Whether the shortage is increasing or decreasing.
6. The effect of the shortage on industry and public welfare.
7. The remedial measures which have

been taken affecting the various localities or industries.

8. Your views as to the merits of such measures.

9. Your opinion as to the necessity of Federal action in the present emergency.

The Big Four—Transportation, Coal, Taxes, and High Wages are running around the circle, and prices are increasing.

Speaking in a similar vein, the *American Contractor,* in answering the question, How many Buildings for 1920? says:

Looking to demand first, we see it is very great—that is, there is a shortage of housing, of roads, etc., which will require much material. But demand to link up with supply must be effective. If a road is needed but the funds are lacking to build it, such a road is not going to influence material prices. Houses may be needed, but if mortgage money is diverted from housing to luxuries or to some other source, the needed houses are not going to influence directly the price of brick, lime or lumber until such time as they become working projects. They may influence the price indirectly, but only so much as they are thought of as becoming active demand in the near future. Therefore, as far as demand is considered, the biggest thought to keep in mind is, "How much activity will take place during the remainder of 1920, providing all materials necessary can be brought to the job?" The determining factors, outside of the price of materials which will make up demand, are (1) money available for building; (2) labor supply; (3) physical posibility of getting jobs done with present equipment and organization for so doing.

Very briefly, the first depends upon the fundamental principle of practicality of investment in buildings built at what are thought by many to be inflated present values. Without going into this, it is safe to say that with raised freight rates imminent, and with no sudden reduction in any cost imminent, there is going to be no avalanche of money made available to building this year. The second (labor supply) will be slightly unfavorably influenced by any action of the railroad board which makes for better service. Some men from the railroads temporarily in the construction industry will be taken back on the roads. Some men thrown out of automobile manufacturing plants because they could not get cars, who are now in construction work, will be taken back. Besides these factors, the fact of any material boost for the railroad men will result in further unrest in the building trades. Still another possible factor will be the using of many unskilled laborers by the railroads to build track improvements. While there are other factors which enter into the supply of labor, the foregoing are the main ones which can have appreciable effect during the remainder of 1920.

The physical possibility of getting jobs done, needs very little comment. There are a certain number of contracters in each city who are organized to take care of work. Lately there has been, as a direct result of the tied-up railroad conditions, some cancellation of buying orders for equipment on the part of these contractors. Supposing for the moment that an unlimited quantity of labor might be had, still an unlimited quantity of work could not be done because of lack of organization to carry on the work. It takes time and effort to prepare for big activity.

Taking the above thoughts into consideration, the sane deduction is that effective demand for building materials is going to be limited during the remainder of 1920.

Looking to supply, we see about the same labor conditions which we see by looking to demand. All labor going into any finished product is going in at high cost. The stocks on hand which may be released upon the facile movement of freight were all manufactured at high cost. The manufacturer is going to be loath to cut costs. The softening of the market during the past month, more noticeable in lumber, has been significant because it shows the catering to the law of supply and demand. The cut was made because effective demand could not meet the high prices.

There is no widespread expectation of any further peak being added to prices, not even in the face of increased freight rates. And going back to our evidence, which points to a limited effective demand, it seems reasonable that even in the face of high manufacturing costs, the manufacturer will have to manage his production so effectively that he can sell at least within the compass of present prices.

The period from the armistice to the present has been a period marked by few business failures. This means that it has been a period wherein profits have come sufficiently easy to keep the marginal producer on his feet. By the same token, it means that the more efficient producers have had a rather wide latitude of profit. Following such a period invariably comes the swing of the business cycle to the period of a large number of business failures. Along with the coming back into full function of the railroads, whenever that may be, may come the time when supply and demand linked together will force prices where only the efficient producer can make a profit.

IS THE COST PLUS CONTRACT PREFERABLE TO THE LUMP SUM CONTRACT FOR BUILDING WORK

By W. J. Austin Vice President and General Manager
The Austin Company, Cleveland, Ohio.

(The following are extracts taken from the speech of Mr. W. J. Austin, delivered before the Builders' Exchange of Cleveland, in connection with a discussion of the relative merits of the cost plus and the lump sum forms of building contracts.—*Ed.*)

IN considering the subject under discussion it would seem that a definition of the two forms of contract should be given. A cost plus contract is one where the total cost, whatever it be, is paid by the owner plus a profit to the builder; a lump sum contract is one where the builder pays the total cost, and may receive a profit or take a loss. In the cost plus the owner assumes the hazards. In the lump sum, the contractor assumes the hazards. How then determine which form is right—or if both are applicable, which one is the better?

A lump sum building contract is based upon an estimate which includes items of cost which are variable and not within the builder's control. The major items are as follows:

Drawing and specifications—the practical responsibility of accurately showing or describing all of the materials and all of the details and all of the qualities and methods of accomplishing the desired results.

The conditions of soil and sub-surface.

The weather.

Market conditions, whether prices advance or decline.

Labor conditions and costs, with possibilities of strikes, lockouts, disasters.

(Continued on Page 653.)

Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; COST LIMIT; LAST DAYS FOR FILING BIDS; FIRMS FIGURING; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Service Station and Garage, 212-222 North Juniper street, Philadelphia. Architect, Charles E. Oelschlager, 1615 Walnut street, Philadelphia. Owner, George Shields, care of Lyric Garage, 231 North Juniper street, Philadelphia. Brick, steel, slow burning construction, 2 stories, 33x120 feet, 60x66 feet, slag roof, cement floors, elevators, fire doors, hollow metal skylights, stone foundations (heating, plumbing, electric work and elevator reserved). Architect taking bids from Kober Const. Co., 34 South Seventeenth street, and D. Henwood, 717 South Sixty-third street, due July 16th.

Bank Building, Thompson, Ash and Kirkbride streets, Bridesburg, Philadelphia. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owners, Bridesburg Branch of the Oxford Bank of Frankford, care of Oxford Bank, Overington street and Frankford avenue, Frankford, Philadelphia. Brick and terra cotta, 1 story and basement, 17x40x48 feet, slag roof, tile and composition floors, stone foundations, steam heat, electric lighting, tile and marble work. Architects taking bids due July 20th. Wills-Ludwick Co., 1708 Sansom street; H. E. Baton, 1713 Sansom street; H. H. Burrell, 206 South Quince street; William R. Dougherty, 1610 Sansom street; Pierce-Henon, Inc., Bulletin Building; Rust Eng. Co., Pennsylvania Building; George W. Corssley, 2264 Bridge street, Frankford, and Edw. T. Bender, 6014 Torresdale avenue, Wissinoming, Philadelphia, are figuring.

Stores (8) **(alts.),** Fifth and Somerset streets, Philadelphia. Architect, J. Ethan Fieldstein, Penfield Building, Philadelphia. Owner, A. Weiss, 1215 Market street, Philadelphia. Flush bulks, electric lighting, tile and marble work. Owner is taking bids.

Stores (2), 628-30 South street, Philadelphia. Architect, J. Ethan Fieldstein, Penfield Building, Philadelphia. Owner, M. Cylinder, 5734 Chestnut street, Philadelphia. Brick, 2 stories, 30x90 feet, slag roof, steam heating, electric lighting, tile work, flush metal bulks. Owner is taking sub-bids.

Garage, 707-11 Tasker street, Philadelphia. Architect, J. Ethan Fieldstein, Penfield Building, Philadelphia. Owner, A. Pestooe, 1625 South Eighth street, Philadelphia. Brick, 2 stories, 52x121 feet, slag roof, cement floor, steam heat, electric light, rolled steel sash. Architect taking bids due soon as possible. Fidelity Const. Co., Bulletin Building; M. Kirschner, 4930 Brown street; M. Yellin, 712 North Franklin street; J. Ostroff, 310 Porter street, and Bldr. Walters, care of architect, are figuring.

Manufacturing Building, Twenty-second and Hunting Park avenue. Architects, William Steele & Sons Co., 1600 Arch street, Philadelphia. Owners, Reyburn Mfg. Co., Twenty-third and Allegheny avenue, Philadelphia. Concrete, steel and brick. Plans in progress. Too early for details.

Track Construction, Cont. No. 572, Frankford Elevated, Philadelphia. Architect, private plans. Owner, City of Philadelphia, Department of City Transit, 1211 Chestnut street. 7,286 lineal feet of single track and 2 crossovers. Lowest bidders: Snare & Triest, Pennsylvania Building, Philadelphia.

Bungalow, Germantown, Philadelphia, $15,000. Architect, Karl F. Otto, Foulkrod and Oakland streets, Frankford, Philadelphia. Owner, Frank E. Smith, care of architect. Stone and brick, 1½ stories, 38x50 feet, stucco, slate roof, hardwood floors, tile work, hot water heating, electric lighting. Architect is ready for sub-bids.

Better Roofs for Less Money—

IF YOU want to find out how cheaply you can build a *good* roof, use Barrett Everlastic Roofings. They are easily laid and give maximum service at minimum cost.

They come in four different styles—two kinds of shingles, both surfaced with red or green crushed slate, and two kinds of roll roofings, one slate-surfaced, the other plain.

On residences and all other steep-roofed buildings, Barrett Everlastic Roofings enable you to build better roofs in less time and for less money.

When buying look for the Everlastic name. It is your safeguard against inferior imitations.

Barrett Everlastic Roofings are carried by enterprising dealers everywhere.

Everlastic Multi-Shingles.
(Four Shingles in One)

The newest thing in roofing—*four shingles in one.* Tough, elastic, durable. Made of high-grade waterproofing materials and surfaced with crushed slate in art-shades of red or green. When laid they look like individual shingles and make a roof worthy of the finest buildings. Weather and fire-resisting. Need no painting.

Everlastic Single Shingles.

Same material and art-finish (red or green) as the Multi-Shingles, but made in individual shingles; size 8 x 12¾ inches. A finished roof of Everlastic Single Shingles is far more beautiful than an ordinary shingle roof and, in addition, costs less per year of service.

Everlastic Slate-Surfaced Roofing.

The most beautiful and enduring roll roofing made. Surfaced with crushed slate in art-shades of red or green. Very durable; requires no painting. Nails and cement in each roll.

Everlastic "Rubber" Roofing.

This is one of our most popular roofings. Thousands upon thousands of buildings all over the country are protected from wind and weather by Everlastic "Rubber" Roofing. It is tough, pliable, elastic, durable and very low in price. It is easy to lay; no skilled labor required. Nails and cement included in each roll.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

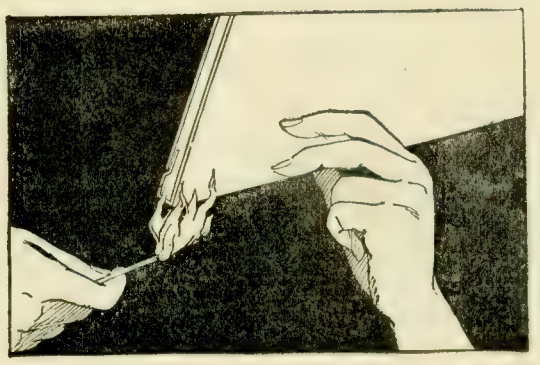
Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.



For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

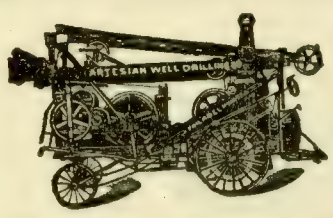
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

(Continued from Page 638.)

Interpretation of contract, drawings and specifications where differences of opinion arise.

What rule applies in the solution of the method? Here is the rule I believe should apply: Where the limits of these variables can be determined in an estimate, and where the sum of any contingency item plus the net profit is equal to or higher than the variable, the builder assumes only the risk of finishing without profit, and also the possibility of adding to his profit by the contingency allowance. This might be considered a fair risk. In practice, however, does the builder, or can he, cover these variables? I believe you will agree with me when I say that on any fair sized operation this is a practical impossibility, and I need not present detailed statements supporting this, because you all know it as well as I do. Is there then in the business any method by which losses may be balanced throughout a period of time? If a manufacturer can sell at a fixed price, why not the builder? The difference is principally a matter of control. The manufactured article is made indoors—within a plant—and in a large measure to meet the inspection, approval and desires of the manufacturer, whose judgment is final, and he may more readily alter prices to meet cost variations.

Experience

The WILT & DURRICK CO. is an organization of men of long experience in interior decorating.

Every phase of re-decorating by means of paint and paper has received our careful study.

We would be glad to submit an estimate.

WILLIAM H. CLAUSEN
27th and Diamond Streets, Philadelphia
DIAMOND 608 PARK 837

A building is erected to meet the exclusive ideas of the owner—two buildings are rarely alike; they are erected out of doors and are subject in a large degree to conditions which are not within the builder's control, and with consequent effect upon cost. Final approval of the work does not lie entirely with him, nor is he free entirely to use materials and methods which he believes will accomplish the desired results. Nor can the builder expect to add to the cost of a new job to balance the losses of the old one. This would be unfair to the new customer, but aside from that, you know how seldom we receive an order on a bid too high, and how easy it is to get business with a bid too low. Is the builder fair to himself, and to the owner, in assuming an unbalanced obligation in which certain items of cost lie entirely beyond his control, and without having either opportunity or method of compensation for such excess costs as arise from uncontrollable items? Remember the variable item is the big 90 per cent. and the only buffer between cost and selling price is the average 10 per cent. which is to cover the usual overhead and profit of the builder.

Considering then that there are these variables, and that full control is not within the builder's hands, what method is best? It certainly is the cost plus system, for it gives the owner his building at fair cost, he pays for the uncertainties if they arise, he is not charged with contingencies that never occur, he can control his quality, he can accept the builder's suggestions for reduced cost methods if he desires, he can combine his purchasing power with that of the builder, he can develop his ideas as the building proceeds, and when the job is done have the assurance that materials and workmanship are as he desires.

With all these advantages, why does the average owner prefer the lump sum—and why does he usually ascribe any unsatisfactory outcome to the system, while the unsatisfactory performance under the lump sum contract is not charged to that method? Principally, I believe, to the fact that our methods of conducting cost plus operations have not been developed to meet the needs of the system. A satisfactory outcome must be based on satisfactory methods. We must have mutual confidence; definite understandings in writing; accurate definitions, especially regarding the scope of the work, and what costs, if any, are borne by the builder. Further, we must have a competent representative of the owner continually on the work, or frequently enough to approve workmanship and methods and accounts daily. We must keep the owner advised of difficulties, must settle all accounts monthly and most certainly have good performance.

There are elements of risk in both forms of contract. Any poor performance under the cost plus plan reflects unfavorably both upon the builder and upon the method. Any careless attitude on the builder's part towards his obligations to the owner will surely be fatal. Close cooperation between the parties is essential.

I do not say that the cost plus contract is always best. We have liked it best on operations of fair size, especially those where speed is essential, and of course under present conditions, practically the only form applicable.

We believe that builders are entitled to fair profits on this basis, and that any tendencies towards meager percentage charges should be corrected. Any able self-supporting organization that renders the owner a good service should both ask and receive a fair profit, and the average owner recognizes that right.—*Building Industry.*

MAKING WOOD FIRE RESISTANT WITH PAINT

Fire retardent paints are the most practical means so far discovered by the Forest Products Laboratory by which small amounts of wood can economically be made fire resistant. The only other known methods of descreasing the inflammability of wood are to keep it wet, or to inject into it certain chemicals under pressure. These methods, though more effective than painting, are usually either impracticable or too expensive to be considered.

Ordinary calcimine or whitewash has proved in tests to be as fire resistant as any paint covering tried. It is cheap and convenient to use. Although it will not prevent the burning of wood exposed continously to a high heat, a good coat of calcimine on wood will decrease the danger of a blaze spreading from burning cigarettes, sparks, matches, and similiar small sources of fire. Calcimine is, of course more effective for inside than for outside use.

For exterior use numerous patented fire retardent paints are available. An effective outdoor paint which has been developed at the Forest Products Laboratory consists of linseed oil, zinc borate, and chrome green. This paint has maintained its fire resisting properties through more than three years of exposure to the weather.

Business is founded on reciprocity and co-operation. Any other plan than this spells bankruptcy. The successful business nowadays has a heart and a soul.

PEP PARAGRAPHS

A man in doubt is a predestined failure.

Self-confidence is a running start in any man's game.

Failure is attained by believing the job too big for you to tackle.

An ounce of hustling is worth more than many pounds of rustling.

A diploma is something to your credit, but after all it's only a diploma.

Don't be a parrot; let your talk show that you have a brain as well as a tongue.

The happiest guy we ever saw was one who sailed right into the thing he wanted to do.

A promise is all right as far as it goes, but it's the fulfillment that buys the baby's rattle.

They tell us not to strike a man when he's down, but sometimes a good, swift kick, properly placed, is a god-send.

Some folks believe so firmly that the world was made for man that they forget that man was made for the world.

If you're looking for success, get busy; if you're looking for something soft, seek a downy couch or a park bench.

After you have dined out with a highly powdered lady be sure you brush off your coat before going home to your wife.

(Copyright, 1920, by S. A. Chandler.)

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

As The Editor Sees It

IN response to the general request of the National Federation of Construction Industries that information be sent to Honorable William M. Calder, Chairman of the Senate Special Committee of Reconstruction and Production, the following exhaustive study and analysis of the situation was prepared by John Irwin Bright by the authority of the Executive Committee of the Philadelphia Chapter of the American Institute of Architects:

To the Hon. William M. Calder,
United States Senator,
Chairman of the Senate Special Committee on Reconstruction and Production.

The Philadelphia Chapter of the American Institute of Architects desires to participate in the inquiry now being conducted by the Senate Special Committee on Reconstruction and Production.

After having conferred with the representatives of the construction associations in the meeting in Philadelphia on June 17th, it feels that its viewpoint on the question at issue can best be set forth in a separate analysis of the situation.

Basic Conditions.

The condition of the building industry can be satisfactorily described by statisticians, as it falls within the realm of ascertainable facts. But while we are interested in observing that its volume is subnormal and its characteristics are abnormal, we are chiefly concerned in seeking the reasons for these phenomena, for the disease can be attacked intelligently only after it has been correctly diagnosed. We, therefore, regard with indifference any proposals for or against a policy of freight priorities, or legislation intended to influence the migration of the laboring classes, convinced that the effect of these or similar measures can only be temporary and cannot materially alter the general situation.

The industrial revolution was brought about by the substitution of machine for hand process in prdouction. It dates from the latter end of the eighteenth century. Notwithstanding that the change in idustrial technique has resulted in a broadening of the scope of human information, the knowledge thus amplified has not been relatively deepened. In spite of the advancement in certain material comforts that the transformation has brought in its train, the sinister fact stares us in the face that for scores of millions of human beings high-speed production, made possible by the use of machinery, has been distorted by man's cupidity from a potential blessing into an actual curse. The modern slum, a legitimate offspring of the central factory system, is little if any improvement over the worst housing conditions of the middle ages. For these reasons we, the architects, find ourselves in complete disaccord with any suggestion which looks for substantial relief in the invention of new labor-saving machinery, not because the machine itself is inherently evil, but because in too large measure its product has been appropriated to private profit before it has been permitted to yield a living wage to its operatives.

Business Interest is the Prime Force.

The construction industry has, in the main, no control over its own product for the reason that it is the servant and tool of other and more determinative forces. The business interest of the prospective owner dictates the choice of site and the character of the building, the direction of the railway and the location of its terminals. It is, therefore, pure waste of time to concern ourselves with the misuse or disuse of the implement while taking no hand that guides it. The desire or the necessity to make a business profit, treating the accompanying social and economic problems as of comparatively small importance, lies at the root of our difficulties and determines to a large extent our actions.

Construction Interest the Servant of Capital.

The construction industry is involved in the present discussion only because it is unable to quote a price satisfactory to the investor. It is out of a job. The

BLUE PRINTS

only thing asked of it is to cheapen its product, and this is manifestly impossible so long as it is organized on a system of wasteful, rather than stimulating, competition, while at the same time its employer continues to hold and exercise the power of increasing the cost of materials that enter into the finished product. Construction is necessary to house and transport the output of labor and cannot be considered apart from the business it shelters.

Present Conditions and Reform.

The two things to be studied are, therefore, first, the direction given to modern life by the theory of business profit, and, second, a reorganization of construction industry by which it may better serve its own personnel and the public at large.

Lack of Capital.

A fundamental cause of the diminishing volume of construction is, of course, the fact that capital can only be obtained for a profit making enterprise. Capital cannot be reasonably asked to sacrifice itself upon the altar of altruism, but, nevertheless, when profit alone is considered, only the highest bidder can obtain credit and sound enterprises are forced to compete with ventures of a highly speculative nature for the favor of money lenders.

The directors of banks, even when their customers are mainly of the poorer classes, administer the funds solely in the interest of their stockholders and themselves and no public condemnation attaches itself to the policy. That the depositors may be sorely in need of houses cannot receive consideration with the directorate unless a speculative builder may prove that he will, within a stated time, repay the capital sum advanced together with interest and premium on the loan. He naturally competes with other builders in search of credit, and when he succeeds it is at the cost of the house he sells. He degrades and diminishes his product until he wins the smile of capital. Thus in an overwhelming sense modern commercial philosophy accepts as axiomatic that service be subordinated to business profit.

The Manufacture of Wasteful Goods.

To a major extent the manufacturing industry is organized for the making of goods for a financial gain without a thought of the service or dis-service they may render to society. The sale of wasteful goods frequently yields a large money return, and, working under a system where the making of a profit rules other motives, the tendency is not only to concentrate on this class of output, but to invent and put upon the market new forms. While the practice is not universal, it is nevertheless true that so large a proportion of our productivity is devoted to waste that the stability of the social structure is being measurably impaired. While the welfare of the community is not totally ignored, it is treated as of secondary importance to the prosperity of the individual.

The Philosophy of the Business World.

This philosophy is generally accepted throughout the business world. It is the reason why the quality of durability of goods is of no advantage to the manufacturer, and in many cases is a distinct disadvantage.

Modern Business Method.

Now the placing upon the market of an avowedly useless article or an article in which the characteristic of waste is predominant, and the deliberate creation by advertising of a public demand for it, is a typical example of modern business method. A thoughtless public has been told that it is the operation of "making something out of nothing," that it is the "creation of wealth," while the very contrary is true. As a matter of fact, it is a completely futile employment of human effort. Its producers are economic burdens upon the community in the same sense and degree as are the inmates of a county poor house.

The Result.

This tendency, harmless enough when pursued to a limited extent, has grown to a point where, in conjunction with other causes, it has made impossible the carrying on of necessary building. While the friction has always existed, the great damage attributable to it has, for several reasons, escaped general attention. It is unobtrusive and all pervading. It does not work in fits and starts, and, therefore, society has been able to adjust itself to the handicap. Its very ubiquity has contributed to its concealment. But the war has unsparingly exhibited the weaknesses of an acquisitive society and what has been regarded as a normal tendency has suddenly become an intolerable oppression.

No Negative Legislation.

The concentration of a great portion of our energy upon luxury production and upon the production of short-lived wealth is the logical resultant of the industrial order. Accepting the system, at least for the present, we cannot legislate against its workings. Hence, to attack it with prohibitions is to invite failure. Indeed, for other practical reasons it would be dangerous in the extreme to forbid the production of any given article, even though all the evidence proclaimed it to be a useless luxury; for such a policy would but too likely sound the death knell of scientific research and artistic expression, the two things which more than any others have contributed to the development of the human race. Nevertheless, a way must be found to provide building for necessary but relatively unprofitable uses.

Capital Helpless.

If the sole aim of the construction industry is to seek employment for itself, then it is probably true that, given a sufficient amount of capital, such an aim could be attained. But there is no chance that in the immediatet or distant future credit, privately controlled, will serve other than the highest bidder, leaving the situation much as it is at present.

The Action to Take.

This rapid and incomplete sketch of our social and economic system reveals how small is the chance that anything of moment can be accomplished by a reliance upon the time-honored formulae. But the situation, although grave, has a fortunate aspect, for it furnishes the opportunity to the construction industry to arise to the occasion.

Let it commence by proclaiming itself an instrument of public service, insofar as its duty to the community will be considered before profit.

Let it refuse to operate in the sole interest of its private employers.

Let it insist that the execution of necessary building, properly related to a general scheme, shall take precedence over less urgent needs.

Let it concern itself with the social and economic welfare of its own personnel as a means to true efficiency.

What will such a program lead to in terms of action?

Necessities of Life.

It is unquestionably true that an industrial system, or even any particular industry, which fails to make possible adequate shelter, food, clothing and recreation for all of its operatives is not worthy to exist. Its basic charter must include the obligation to so distribute and so place its earnings that the employee will be afforded a fair opportunity to purchase the necessities of life.

The Lack of Houses.

With housing standing in the first group of civilization's demands, the terrible indictment lies against the industrial system that throughout the entire world it is impossible to build a home for those earning low wages or salaries at a cost

Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.

For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

Write or Phone.

air heating, electric lighting. Plans in progress. Will be ready for bids in two weeks.

Church (alts. and add.), Pitman, N. J. Architect, George E. Savage, Witherspoon Building, Philadelphia. Owner, Methodist Episcopal Church, Pitman, N. J. Frame, 1 story, 38x75 feet, shingle roof, pine floors, stone foundations, steam heating, electric lighting, ornamental iron work, plastering, painting, plumbing, sheet metal work, carpentry and mill work. Architect taking bids due July 29th. F. B. Davis, 240 North Sixteenth street; Hogg Const. Co., Denckla Building, Philadelphia; W. A. Lacy, Pitman, N. J.; H. Hoffman, Pitman ,N. J., and W. A. Adamson, Paulsboro, N. J., are figuring.

Store and Bachelors' Apartments, 5 South Penn avenue, Atlantic City, N. J. Architect, Wm. Childs Hodgens, 130 South Fifteenth street, Philadelphia. Owner, M. Rosenbaum, care of architect. Brick, 3 stories, 17x60 feet, slag roof, pine floors, stone foundations, hot water heat, electric lighting, iron work. Architect taking revised bids, due as soon as possible. Lam Building Co., 1001 Wood street, Philadelphia, is figuring.

Miscellaneous Construction News

Residence, Elmira, N. Y. Architect, C. E. Schermerhorn, 430 Walnut street, Philadelphia. Owner, Lauren E. Bishop, Elmira, N. Y. Hollow tile and stucco, 2 stories, 35x45 feet, shingle roof, hardwood and pine floors, stone foundations, hot water heating, electric light, tile work. Owner is taking bids.

Church, St. Pierre, Martinique. Architect, Guy King, 1513 Walnut street, Philadelphia. Owners, Catholic Church of St. Pierre, care of Father Duffy. Coconio rock, tile roof, tile floors, stained glass windows, church furnishings. Plans completed. Owners will build.

School, Silver Run, Md. Architects, Markley & Starr, Spooner Building, Harrisburg, Pa. Owners, Board of Education of Carroll County, Md., care of architects. Tile, 1 story, 100x120 feet, stone foundations, slag and slate roof, pine floors, vapor heating, electric lighting, rolled steel skylights, roof ventilators. Contract awarded to Israel Cross, Silver Run, Md.

Building, Boaz, Ala. Architects, Magaziner & Eberhard, 603 Chestnut street, Philadelphia. Owners, John H. Snead Seminary, Boaz, Ala. Brick, 2 stories, 100x200 feet, slate roof, electric lighting, steam heating. Contract awarded to Inglenook Const. Co., Burlington, Ala.

Proposals

INVITATION FOR PROPOSALS.

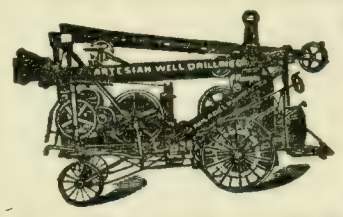
TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., July 14, 1920. Sealed Proposals will be opened in this office at 3 P. M., August 5, 1920, for remodeling in the United States Post Office building at Jersey City, N. J. Drawings and specifications may be obtained from the Custodian of the building at Jersey City, N. J., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

AS THE EDITOR SEES IT

(Continued from Page 660)

which will allow it to be rented or sold without a loss. In order to house decently the present population of the United States from ten to twenty billions of dollars will have to be expended. Private initiative for this purpose has entirely broken down and the home, one of the main reasons for the existence of industry in any form, is and has been for many years practically unattainable for a constantly increasing portion of the human race. By what right do we spend our time in debating the case for industry or the buildings which shelter it when the only motives for its establishment are in default?

A HOUSING PROGRAM.



The manufacture for profit of the skilled wage earner's home, never sufficient in quantity or quality, has now ceased.

The manufacture for profit of the unskilled wage earner's home has, largely speaking, never existed.

In view of these facts, we, the architects, propose that housing for those earning low wages or salaries be legalized as a public utility; that the manufacture of this class of homes as a profitable in-

dustry should cease in theory as it has already ceased in fact, and that the government, national and local, should at once adopt measures making possible the supply of this prime necessary of life.

The Economic Program.

Eventually industry must be so organized that the opportunity will be afforded to all those engaged in it to earn their living in the full sense of the word, but under the present circumstances we believe that we have indicated the one possible course of action. This program does not avoid the loss. Only in special cases will it be met by private interests, and then only when it can be collected from the profits of production. The capital will have to be supplied from the public purse and the loss will be met by the difference between the interest charged and the market rate or by an undisguised subsidy or by both. There is no escape from this dilemma other than by a complete change in the capitalistic society, and that, of course, is not here advocated. The principle of remunerated service as opposed to speculative profit must be the cornerstone of the edifice. Even State aid will break down if the value which it creates is constantly dissipated. It is not pretended that we are offering any detailed scheme of operation. We are now contending for a principle and at the proper time we stand ready to assist in its realization. We submit that whenever our system of business for profit fails to provide any of the basic necessities of life, then the task, ipsfacto, should devolve upon the public authority; that while the principle is now accepted for public education, water supply, etc., it must be extended to housing. A refusal to meet the obligation will spell disaster to society as it is now organized.

Such a building program, vigorously pursued, would occupy the energies of the construction industry for years to come and would mean the creation of durable wealth at a rate not hitherto attained in our country.

Loss of Wealth.

Construction is wealth, and like all wealth, is consumable in a degree. Its disappearance, due to obsolescence, unsuitability, disintegration, fire, neglect or any other cause, is, therefore, loss to the community. In proportion as the production of wealth is sacrificed to the making of a profit, the durability of that wealth decreases. When consumed it has to be re-created. It is a duplication of effort. The problem is to determine what part of this annual loss is preventable and then to take measures to overcome it. What part of our building program is considered from the viewpoint of an addition to the national wealth and what part is frankly designed for the sole purpose of making a profit? The true answer to these questions will show that the element of service has been obscured by the desire to reap a personal reward to a point where the drag upon our national resources fills us with apprehension.

The Necessity of the Planning of Cities.

But it is not enough that houses shall be merely built. It must not be forgotten that in erecting homes, factories and shops, we are creating towns and cities and to proceed on the old selfishly thoughtless or thoughtfully selfish lines will only increase urban congestion, and in the end magnify rather than diminish our troubles. In the execution of any such scheme as we propose, we must strive to see clear through to the end, in order to lighten, if possible, some part of humanity's unnecessary burden.

The slightest reflection will lead to the conviction that a more thoughtful placing of buildings will diminish the waste factors of obsolescence and unsuitability. Indeed, the advantage of scientifically planning our building development once admitted, our group is prepared to submit documentary evidence that the losses due to the planless accretion of our cities and transportation facilities represent an annual loss of hundreds of millions of dollars. This loss bears with crushing weight upon the construction industry, for no enterprise can be healthy when so much of its effort is uneconomic.

The Planning of Cities and Lines of Communication.

An answer to our special problem cannot be found without examining the physical structure of our cities and their connecting transportation lines of every character, for these things are construction itself, and it is only by planning them definitely and scientifically and building them honestly that there is any hope of diminishing the present alarming waste of human effort and capital.

A Survey.

The placing of buildings and the layout of our transportation lines is a matter of growth, planless in the sense of any correlation of the part to the entirety, but rigidly controlled by the underlying philosophy of modern business enterprise, the making of a profit. Now this policy has generally been accepted as sound, as a conservative and prudent development of "natural tendencies," but it has led directly to the most uneconomic, the most wasteful scheme of life ever devised.

To increase in size is the major ambition of our cities and is an aspiration to which all others are subsidiary. With few exceptions, city plans are based upon the conception of unlimited inflation and permission to study methods by which urban life may be made more tolerable is only granted upon the well understood condition that nothing is to be done looking towards the elimination of the selfsame causes that have made urban life so hard to support. No wonder that city planning is largely futile.

The theory is founded upon a negation, the desire to do nothing which will decrease the value of urban land. The theory is positive in that it guards jealously the supposed right of the individual to reap a speculative profit on land. It operates to increase concentration at the center and diffusion at the perimeter, both tendencies pursued to a point where, after a certain size is reached, the city becomes an economic impossibility. And here is where we now are. Due to these and other causes, it has grown to a degree of immensity which makes impossible the financing of its public utilities. The universal predicament of street railways is an illustration. But in their special case there are difficulties which complicate the financial problem, for by reason of the great distances to be covered and the enormous number of passengers to be transported, they can be operated only at the cost of infinitet discomfort to the public.

Distributtion of Values.

The conception of the modern city is based upon fundamentally wrong economics and contains the seeds of its own destruction. Any system of economics which takes and does not return, any systetm of agriculture which, having produced the crops, takes no measures to restore the fertility of the soil, any system of physics or philosophy which allows the appropriation of energy generated by effort and takes no measures to cancel the debt is destined to exhaustion just as surely as is a constantly worked coal mine. The value created by the community belongs to it, and when diverted to individual use, results in public bankruptcy. In violation of this law of nature, the increment, loosely and deceptively qualified by the word "unearned," is partitioned amongst the few and the powerful to the despair and impoverishment of mankind.

To expect the construction industry to be possessed of a healthful life in such

Building Lime—Buy pure lime, no core, no grit—Chemical Lime. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Phila. Both 'phones.

an atmosphere is unreasonable. It is suffering from the very situation which it is employed to create.

There can be no way out until the principle of public service receives recognition as a practical working force—until business for private profit is brought within reasonable bounds — until our cities are restored to en economic form and size, a quite possible thing to accomplish—until our lines of communication and their terminals are planned for the service to be rendered, and not only for a money return.

If the objective seems to be beyond our reach, it is principally because we have never made any serious, concerted effort to attain it.

Folsom & Stanton, architects, formerly of 1328 Walnut street, have opened offices in the Fuller Building, at 10 South Eighteenth street, Philadelphia. The telephone number is Spruce 2318.

LABOR IN PHILADELPHIA BUILDING TRADES TAKES ADVANCED ACTION

Request Architect to Act as Counsellor and Leader in Movement for Co-operation in Building Industry.

The council of the Allied Building Trades, representing nineteen different labor unions in the American Federation of Labor, at a meeting of its Executive Committee last week, took a step destined perhaps, to be epoch making not only locally but nationally. Action which has been pending to request D. Knickerbacker Boyd, former Secretary and Vice-President of the American Institute of Architects, as well as a leader in Local Construction and City Planning movements, to act as spokesman for Labor in all local affairs, was formally ratified.

Discussion on the part of all delegates present at the meeting emphazed the fact that the greatest lack of co-operation and co-ordination exists in the Building Construction field today. It was pointed out that continual strife between the employer and the employed seemed to be no nearer termination than before,—in fact was bordering on a breach, and that in the face of all this unrest, meetings were held by Employers' Organizations and Labor Organizations, always separately. Opportunity seemed to be lacking and the spirit not present for these organizations to get together and thrash out difficulties or possible methods of adjustment and arrive at amicable understandings.

The representatives contended that labor acted alone because it had to. Through lack of opportunity for contact with any one central organization of employers or even with various separate organizations, the meetings of Labor were not fraught with the full idea of service as it was deemed they would be, were opportunities offered for joint meetings with all concerned in the building industry. With respect to meetings of Manufacturers, and other employers, labor, it would seem, had not been consulted in matters which were obviously of mutual concern and affected the public welfare.

Such for instance, it was mentioned, were the meetings of the Committee on Industrial Relations of the Philadelphia Chamber of Commerce, which had been holding frequent conferences and framing declarations of principle, affecting employers' relations with labor and without ever a word from Labor on the subject.

Representatives of the Bricklayers' Union explained what strides had been made in that Industry in but one short season through simple human understanding, brought about by contact with all factors in that branch of the Building Industry. Mr. William J. Haggerty explained how this had originated through the interest shown by D. Knickerbacker Boyd, a former President of the Philadelphia Chapter of the American Institute of Architects, now Chairman of the Chapter's Committee on Education in the Crafts and Trades, a member of the Board of Directors of the Engineer's Club and connected with many other local and national organizations. This followed an address which Mr. Boyd gave before the Council of the Allied Building Trades last autumn, at which he urged that Labor should devote a larger portion of its meetings to matters of Education and Information and that meetings of Organized Labor should concern themselves with improvements in the various Crafts and Trades and that discussions of wages and hours should give way to discussions of opportunity for co-operation with all others and service to the public at large.

This work, begun in the Allied Building Trades Council, led to conferences between several of the Industries and architects and others, notably in the case of the Bricklayers' Union No. 1, which requested a conference with Mr. Boyd and other architects at which were present C. C. Zantzinger, John I. Bright, M. B. Medary,Jr., Horace Wells Sellers and Victor D. Abel. A committee on education was formed in the Bricklayers' Union, consisting of James O'Neill, Chairman; F. X. Sullivan and William J. Haggerty. This led to the formation of a Class in "Plan Reading" which was conducted by Mr. Abel, of the Architectural firm of Boyd, Abel & Gugert. At every weekly meeting of the Union, during the past winter, addresses were given by men prominent in City, State and Nation. These included speakers from the University of Pennsylvania, the U.S. Bureau of Standards, the Philadelphia Board of Education, the Master Builders' Exchange and the Local Brick Manufacturers' Association.

All this it was pointed out, had the effect of awakening in every workingman a greater interest in his daily task, had made him more efficient, more appreciative of the aims and ideals of the designers and occupants of buildings and in all, a better citizen.

These results were ascribed almost wholly to the spirit which had been aroused by co-operation and human contact. Arguments were advanced to prove that similiar results could be expected in each branch of the Building Industry and conditions improved in each if the employers' organizations could be brought face to face with the fact that they too had obligations to fulfill toward Labor as well as those which Labor organizations were expected to recognize towards employers, and each toward the public at large.

In view of these facts and that it was considered, as far as the Building Industries was concerned, that architects represented the consumer, the building public, in a way approached by no other trade, business or profession, it was determined that the building branch of Labor should place its confidence in a representative of the Architectural Profession to bring building labor, into contact with all builders, contractors, and others, and eventually all into a closer relation with the Building Public.

Without a dissenting vote, it was decided that D. Knickerbacker Boyd should be accorded this confidence and asked to be the representative of Organized Labor in Philadelphia; and he has been requested so to act. He has been officially notified of his selection to this important and unusual post and his acceptance has been urged.

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

It is the intention of Labor to have him head a committee of nine—four members of which have already been appointed by the Council. These members are William J. Haggerty, James M. Myles, A. G. Haws, President of the Council, and Daniel T. McKenna, Secretary of the Council.

In addition to this unprecedented confidence, reposed in a single individual outside of Labor's ranks, Mr. Boyd has been given full authority to select the other four members of the Committee and to act meanwhile as Labor's spokesman before any organization of Builders, Contractors, Material Men, the Chamber of Commerce and other bodies.

Mr. Boyd has the matter under advisement and is conferring with all interests above mentioned as to the personnel of the four members of the committee. Such a committee in co-operation with the Committee headed by Mr. J. V. Irwin, of Irwin and Leighton, and any other officially designated Committee, may conceivably and perhaps promptly function as a Tribunal in the Building Industries, which, it is understood, Labor would favor, and should be considered by both employer and employed, in the light of a Supreme Court to determine all matters of policy in the important industry of Building Construction.

Is it not high time that some action looking toward co-operation such as this should be put under way? And is it predicting too much to say that with Labor stabilized in the construction field materials would follow and the way be opened for progress so highly to be desired in overcoming the shortage of buildings of all types, notably houses and industrial establishments?

AN ENGINEERING ANALYSIS OF THE LABOR PROBLEM

BY CALVERT T. TOWNLEY

*President of the American Institute of Electrical Engineers**

To begin with the first law of nature is self preservation. It is manifested in its highest form as patriotism, in its lowest as sordid greed. Between these two extremes appear all forms of selfishness, many of them by no means blameworthy, others under control or not infrequently dormant but nevertheless certain to manifest themselves when circumstances compel. For example, selfishness is the actuating motive in barter. It leads the seller to try to sell at the highest price and the buyer to try to buy at the lowest. Barter and trade are at the foundation of industry and having been always recognized as essential to prosperity, have been encouraged and protected. This form of selfishness has acquired great respectability, but while the practice of matching wits in trade is supported by the people of all lands, the sanctity of contract is also fundamental, i. e., that form of selfishness which leads to the violation of an agreement once made is everywhere decried and condemmed. It has been demonstrated that selfish human nature will assert itself and that good faith cannot be relied upon, therefore recourse has been had to another powerful trait—fear. The exercise of the police power with its penalties for transgression is based on fear of the consse-quences.

The ideal condition for barter is where both parties are absolutely free agents and neither therefore under duress. Although such a condition is seldom realized, when the duress becomes so extreme as to constitute oppression the desperation of the oppressed may be counted upon to devise resistance. Just as surely as political oppression has throughout all history led to political revolutions so has commercial oppression caused commercial revolution. Too great power, if continued long enough, will always be abused, and just as such power in government becomes tyranny, similarly too great advantage in barter begets commercial r o b b e r y. These statements sound like platitudes, and I should hesitate to repeat them were it not for the fact that they not only bear directly on the present situation between labor, capital and the public, but seem to be so frequently forgotten and ignored. Please remember that I am not blaming or praising any one. I am trying to recite cold facts and to call things by their right names.

In the time honored barter between employer and employee, the employer formerly held the strategic position. If he refused to pay the wages demanded by any individual there was usually some one else willing to accept a lower rate and the unemployed one not being mobile and usually having to work to live was soon forced to yield. As business concerns grew larger this advantage naturally increased and just as naturally the employers' power was abused. Bye and bye the resulting oppression became sufficiently acute to provoke general resistance and the labor union came into being. Workmen banded together to eliminate competition among themselves. It should be noted that the establishment of unions did not suspend the operation of the law of supply and demand, rather did it allow the law freer play by counter balancing the power of the union against the previous strategic advantage of the employer. The effect was generally benefical because it corrected an evil, and the general public, while not particularly interested, looked on approvingly. But early in their history the unions made a serious although not a surprising blunder. They set up a system of contracts between employer and employee and, because they could not escape doing so provided no means by which the workmen could be penalized for violation, except by the union itself. This flagrant flouting of a fundamental did not for a time have any serious effect but the blunder once made was never thereafter corrected and it is probable that even today it would be difficult to find a labor leader who could be made to see the seriousness of this mistake, much less to endeavor to rectify it. I pass quickly over a long period of years after the first organization of unions during which unionism had its ups and downs and came to be regarded, if not with equanimity, at least with tolerance by the employer class, and come to the recent world war.

Here an entirely new condition was created—an imperative demand for men came up almost over night. It simply had to be satisfied at no matter what price. At the same time not only was the supply diminished by those required for the armed forces but immigration stopped as well. The effect on the price of labor was axiomatic—it rose. The unions being the vehicles through which the demands of many classes of workmen could most readily be expressed at once became active. The law of supply and demand was fighting on their side and they made the most of it. Wages and prices rose to hitherto unheard of figures. Labor had too much power; their demands had to be met whether or no and of course they abused their power. Then the unions made another mistake. They credited too much of their successes to their organization and failed to appreciate the part played by the law of supply and demand, also they underestimated the power of resistance which would be engendered by oppression. In their turn they became the oppressors—insistent, arrogant. Where their principal weapon —the strike—was not effective as against the employer class in one industry, they enlisted the workmen in other industries and who had no grievance, in sympathetic strikes. They asserted their power to dominate the public convenience, safety

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

and health in order to coerce their opponents into submission to their will. Were it necessary I could recite many specific instances to prove this fact but I assume it to be so generally known and accepted that a recital would be superfluous.

Now this is the condition today and is one which has caused much grave concern and has produced many strange ideas. We hear that a new order of things has come to pass; that the "rights" of labor must now be respected; that the workmen will hereafter have a greater share of the products of his toil; that he must share in the management of industry and have a recognized place in government and the like. To my mind, the facts warrant none of these assumptions. There is no new order—economic laws are the same as they always have been. They are as ruthless and as inexorable as are the laws of physics. Neither has human nature changed. The unions are in the saddle but to use a hunting expression, they are riding for a fall. Please let me remind you again that I am not blaming the unions—or any one else. I am trying to confine myself to statements of fact and to logical opinions based thereon according to the precept and training of the engineer. Suppose we analyze the fundamentals.

In our system of government where every man can vote and have his vote counted and with our multitudes of newspapers informing everybody what is going on, there is little chance that a condition can arise such as that of China, or of Russia, or even of Germany. Further, while we talk a great deal of politicans and parties, we know that on any really vital question the people are going to make up their minds themselves and will elect men who will carry out the wishes of the majority. In other words, the great majority rules.

The number of workmen in labor unions is variously estimated to be from 10 to 40 per cent of the men employed in trades where there are unions. These figures represent the extreme claims of the contending parties. We shall probably not be far wrong if we take a compromise figure say 20 per cent. In the largest class of all, the farmer, there are no unions and similarly none in many other avocations, so if we consider the total voting strength of the country, the percentage of men in unions is certainly not over 10 per cent. and probably not over 5 per cent. Of this small proportion a few are the leaders, a larger number enthusiastic followers, and the great majority largely governed by conditions. By that I mean they are loyal unionists when the union is succeeding but desert on small provocation when it is defeated. This is almost obviously true because the workmen are banded together to accomplish selfish purposes and no other. The individual workman cares no more for his fellow as a class than does the employer. It follows, therefore, that a union must continue to succeed or it will disintegrate and disappear. The history of the last thirty years has recorded many once powerful unions, even the names of which are now almost forgotten. The "Knights of Labor" and the "Amalgamated Associations of Iron and Steel Workers" are two examples which illustrate this point. The strength of organization contending against the mob is very great and it is probably true that so small a proportion of 10 per cent or even of 5 would prevail under these conditions. That in fact is the situation confronting the nation to-day.

This small organized percentage supported by the operation of the law of supply and demand has prevailed, but looking into the future it seems clear that there is only needed a sufficient incentive to induce the unorganized 95 per cent, or even a small part of them, to get together in opposition to the 5 per cent in order that the latter may be overwhelmed. This incentive has been or will be furnished by union oppression. I say "has been or will be" because the abuse of too great power always grows. Therefore if the unions shall still continue to gain their ends even in the face of their present insolence and ruthless disregard of others, their arrogance and self-confidence, born of such success, will inevitably lead them on to acts of greater and yet greater oppression until they force their opponents to combine against them for defense or even for self-preservation. The moneyed class never has had and probably never will have much sympathy or co-operation from the general public for the very obvious reason that the general public is jealous of them. Sympathy goes naturally to those who are worse off. The moneyed class being better off then the great majority, therefore come in for sympathy with a minus sign, that is, jealousy. An incentive which will induce the public to oppose the unions can therefore be sufficient only when the reason is strong enough to overcome this jealousy. That reason becomes sufficient when the need for self preservation is made clearly apparent. Already there are indications that the people will not much longer submit to dominations by the unions. The governor of Massachusetts defied them, was shortly thereafter re-elected by an abnormally large majority, and has now been nominated on the Republican national ticket for Vice-President, which later distinction, it is safe to say, he owes almost entirely to this incident. The state of Kansas has enacted a law to curb union interference with the peace and comfort of her citizens and her governor has become a popular national figure in consequence. The temper of much of the daily press has changed and where formerly there was much said about the so-called "living wage" and criticism of "capitalistic greed" there now appears articles about "the vicious cycle of mounting wages and costs," "loafing on the job." and the "need to teach the people thrift and economy." These and other signs are merely symptons of the incentive to resistance that may be expected to be superinduced by oppression The aroused public would not be just to the unions and an attack once thoroughly launched might be expected to go further than it should. However, I am not here discussing justice or how either party should behave, but rather what they have done in the past and under the pressure of human nature and economic laws most certainly will do in the future.

Whether or not an aroused public does curb union domination, the present high wage era will not be radically effected. That is a condition controlled not by the unions at all but by the law of supply and demand. Even the complete abolition of the unions, while it might check further wage increases and perhaps bring about some recessions, and while it would reduce living costs somewhat by cutting out interruptions and tend to increase production, would not itself either increase the supply of workmen available nor decrease the demand for their services. Indeed, while I have discussed the fundamentals of barter between the employer and the employee and have endeavored to show the natural reactions resulting from barter with either party under duress, it is not at all certain that conditions will become so extreme as to bring about the reaction described. That is to say, instead of the abuse of power by the unions being curbed by the organized oppression of other classes of our people it may be reduced or even thwarted by the operation of the law of supply and demand. Lest I may be misunderstood I might here state that because I have been confining

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

myself to a discussion of the relations between employer and employee and have much to say about the employee's abnormally high wages, I do not want to be understood as giving that condition as the only cost of the prevailing high prices. Advantage has very generally been taken of the opportunity to increase profits by those who had wares to market, which is only another way of saying again that selfishness is a universal trait of which no class or classes has a monopoly. A bettering of conditions may be affected by a decrease in the demand for an increase in the supply of labor.

Already there is a marked reduction in the sales of certain products resulting from an unwillingness or the inability of many people to pay the exorbitant prices asked. Government reports of falling exports indicate that the expected lessening of the foreign market for our high priced products is approaching and it is not at all unlikely that this may be followed by heavy increases in our imports which will displace American made goods. This result may come about both because foreign nations are getting into their stride of production again and because the high prices prevailing here have naturally created an attractive market. A combination of these and other conditions will reduce the demand for our products and consequently for the workmen to produce them. The immigration authorities of the port of New York report their facilities overtaxed to handle the large numbers coming to our shores, and say that even those numbers would be far larger if there were only more ships to carry the people who want to come. It is natural to suppose that as the heavy burdens of after-war taxation are brought home to the foreign people an increasing percentage will seek to escape them by coming here to live and also that the gradual restoration of trans-Atlantic shipping to its normal schedules will afford the greater facilities thus demanded. This augmentation of population, largely workmen, of course will swell our supply and likewise tend to correct any shortage that may exist.

If my analysis of the fact is correct, it is clear that the present domination by organized labor is temporary and also that the era of high prices will pass. Therefore, no material permanent change in either our social order or in our industrial structure is to be anticipated. In the contest between brains and brawn, waged since the world began, brains have always won and brains always will. Free play for the natural forces of trade may be counted upon to exercise a beneficent influence and they should be hampered and interfered with by government restrictions as little as possible. We cannot, of course, determine from history or from any facts at hand, how long a time it will take for conditions to become normal again, but what we need now is clear thinking, courage and patience.

---

*Address delivered before the annual convention of the American Institute of Electrical Engineers, White Sulphur Springs, W. Va., June 29, 1920.

PEP PARAGRAPHS

A hang-dog look never won a prize position.

The man who says, "I can," seldom is canned.

Catch a man off guard, and you've got him whipped.

One second at the right time is worth more than a thousand tomorrows.

It has been said that ignorance is bliss, but that doesn't apply to business.

Many a poor boob has lost out for no other reason than that he wasn't looking ahead.

Even a poor plan well carried out will net greater results than a jim dandy that fails to get support.

Low-brows match pennies because it requires little mental concentration; high-brows match wits for the opposite reason.

You can't tell what's in a man's head by looking at its shape any more than you can tell what's in a barn by looking at the door.

Trust a poor common dub who knows that he's not over-intelligent in preference to a really intelligent sap-head who's fully aware of his brilliancy.

Don't ask for a raise on the theory that the boss ought to give you more; make yourself worth more than you're getting, and then ask what you are worth.

Two ways of breaking a friendship: strike a man on the bean or touch his pocket-book. But for safety's sake, choose the lesser course, and leave his pocket-book alone.

(Copyright, 1920, by S. A. Chandler.)

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

Repitition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

Ideals are like stars; you will not succeed in touching them with your hands, but like the seafaring man on the desert of waters, you choose them as your guides, and, following them, you reach your destiny.—Carl Schurz.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A five-spot insures it fifty-two times in the course of a year.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

"Camouflage" doesn't pay in advertising. Don't call your cannon a bit of landscape. Be honest and gain the confidence of the public.

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Many a man would do a better job if he didn't know about putty.—Ex.

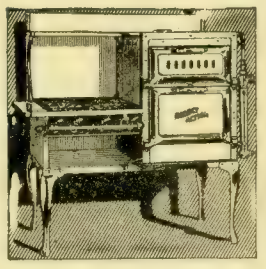
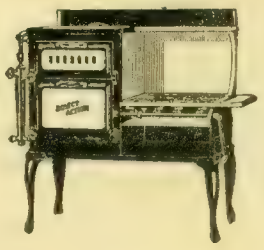
SIZES FURNISHED ON APPLICATION



DIRECT ACTION Gas Ranges



Save Gas

Save Time

Save Food

Save Worry

besides adding to the beauty of the kitchen. Positively "the best" gas range on the market, because the oven heat regulator enables the operator to obtain the same results at all times. We have equipped large operations with the DIRECT ACTION, besides furnishing many hundreds for individual homes. A booklet telling how "wifey" can go out and enjoy the beautiful afternoon—"hubby" doesn't have to worry about dinner, it will be ready when he arrives—is yours for the asking, or better still, see the range demonstrated in our showrooms.

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

ANCHOR POST FENCES

are built on anchor posts which are driven into the ground and then held rigidly erect by two Anchor stakes driven diagonally through slots clamped to the sides of the posts.

Iron Railings and Entrance Gates, Lawn Fences, Tennis-Court, Poultry and Kennel-Yard Enclosures, Arbors, Trellises, and Flower-Bed Guards. Catalogues of any or all are yours upon request.

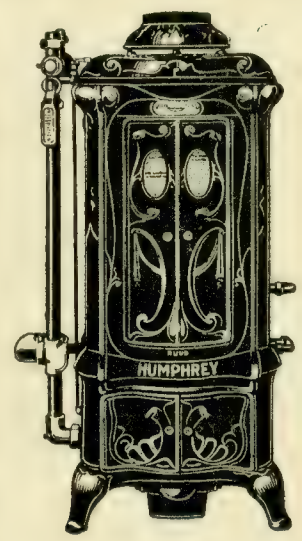
A Few of the Reasons

why you should install the **Peninsular Combination Range:**

A Range that burns either Gas, Coal or Wood without any changing or removing of parts—separate or both at the same time—whose oven is always ready for instant use.



A Range that takes up no more space than an ordinary kitchen range, bakes and broils perfectly under all conditions and gives a lifetime of such service.

A Range that makes the kitchen cool in Summer, warm in Winter—beautiful in design, substantial, and easy to keep clean. Secure our prices.

KLEIN STOVE CO.

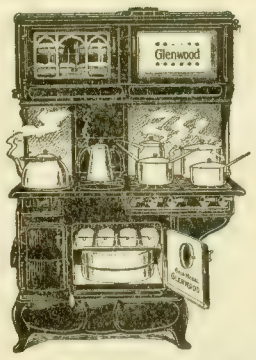
Bell Phone, Market 3879 **PHILADELPHIA, PA.**

THE MOST FOR THE MONEY

Your clients don't want a cheap water heater—they want hot water economically.



There's a difference. Cheap water heaters cost too much to have around.

Humphrey Automatic Gas Water Heater service appeals to the householder as the ideal, dependable hot water supply. Get the details. In the interest of your patrons specify the Humphrey.

Heat the Whole House Cut Fuel Bills

There are no cold rooms in the home heated by the Pawnee Pipeless Furnace. This simple, efficient system maintaims an even temperature of 70 degrees throughout the entire house even in zero weather at a fuel saving of from 25 to 40 per cent. No pipes, no repairs. No coal gas or dust. Low initial cost. Easily installed in about a day without tearing up walls. Burns hard or soft coal, coke or wood. Write for illustrative booklet.

As The Editor Sees It

WE can not see any reason for uncertainty as to the future af the construction industry. People must have homes, and with the curtailment of building during the war, there began a shortage in homes, which must be made up. The factors which are contributing to a temporary limitations of building must be disposed of, and and there is no doubt that the next five years will be the biggest that building has ever seen.

In a report recently prepared by the Fuller Industrial Engineering Corporation for the George A. Fuller Co., subsidiary of the United States Realty Co. is given a careful analysis of the situation.

"A great many manufacturers and property owners have written us," says the Fuller Corporation, "that they were considering new work, that they wanted to build a needed additional space, but hesitated to begin construction because building costs were so high. They have asked us 'when will building costs be lower?'"

"There are three conditions which might bring about a reduction in wages costs: 1. A reduction in demand. 2. A reduction in wages of labor. 3. A reduction in price of building materials.

"A reduction in the demand for additional construction is highly improbable, in view of the present shortage of building space which has resulted from a slowing down of commerical and industrial building during the period of the war.

"As to the hope of a reduction in building costs due to a reduction in wages paid to labor, it does not seem probable that the laboring man will be content to accept any reduction in the size of his pay envelope. His attitude is rather to force wages to higher planes.

"The hope of a reduction in the cost of building materials rests very largely on the hope of a reduction in wages, because, for every dollar spent for brick, cement or steel which goes into a building, from 85 to 90 per cent of such ultimately goes back to the laborer who dug the clay, mined the coal, burned the brick, ground the cement, rolled the steel and transported all of them over to the railroad lines to the site of the work and built them into the structure. Until these related wages go down therefore, it is not reasonable to expect any substantial reduction in the price of building materials.

The average of new building construction in the cities of the United States, from 1911 to 1919, inclusive, show the following:

	Cost of building constructed	Av. cost per sq. ft.	Sq. ft. built
1911..	$962,499,700	$1.59	605,300,000
1912..	1,027,515,200	1.63	630,400,000
1913..	980,971,600	1.61	609,300,000
1914..	891,845,500	1.55	575,400,000
1915..	931,937,300	1.52	613,100,000
1916..	1,137,160,900	1.82	624,800,000
1917..	816,941,000	2.27	358,500,000
1918..	492,163,900	2.65	185,700,000
1919..	1,467,821,300	3.20	458,600,000

"The low average cost per square foot of building constructed shown in the above table," says the Fuller Corporation "is due to the high percentage of floor space which consists of the cheapest kind of factory construction, amounting to little more than sheds. The average cost per square foot of modern factories of reinforced concrete, or other fireproof material, as well as of first class office buildings and hotels, is much higher, the range being from $3.50 to $10.50 per square foot, depending upon the character of structure and its locationi

"For the years of 1911 to 1914, inclusive, the estimated average amount of new buildings was equivalent to 605,000,000 square feet of floor space per annum. In 1918 less than one-third of this amount was done, and even in 1919, in spite of the large money expenditure, the amount of building done was 146,500,000 square feet below this figure. Hence, it is clear that ever since the end of 1916 the average building space has been running further and further behind requirements.

"Owing to the increase in population, at least 10 per cent more floor space is required to be built annually than before the war. Otherwise expressed, we ought

DRAWING MATERIALS

BELL PHONE, SPRUCE 1256 KEYSTONE PHONE, RACE 614

BLUE PRINTS

to have built about 650,000,000 feet annually during the past three years, or 1,950,000,000 square feet in all. We actually built only about 1,002,800,000 square feet, and this leaves a shortage of 947,200,000 square feet. At the present time, we are building at the rate about 550,000,000 feet per annum.

"Thus we see that in order to make up during the presnt year the existing shortage of housing space we would have to construct dwellings, factories and offices having an aggregate floor space of about 1,597,200,000 square feet, or almost as much as we ever built in any three past years.

"It appears therefore, that we are about 18 to 21 months behind in our building program, and that the total amount of building operations during the few years must not only rise to the average normal yearly requirements but must exceed those requirements sufficiently to make up the shortage which accumulated during the past three years. With this shortage to be overcome, there is no likelihood of a decrease in building operations, but on the other hand there is every reason to expect an increasing demand for some years to come.

"As evidence of the volume of building which is done despite high prices, the Fuller Co. has now under constuction more than $32,000,000 worth of work contracted for since the first of the current year, which brings the total amount now on its books to over $60,000,000.

The following tabulation shows the increase in cost of materials and labor which had taken place to Jan. 1, 1920:

MATERIALS.

Common brick—$25.00 per m.; increase since 1913, 257 per cent.

Lumber—$58.00 per m. b. m; increase since 1913, 127 per cent.

Cement—$2.80 per bbl; increase since 1913, 77 per cent.

Sand—$1.25 per cu yd; increase since 1913, 150 per cent.

Structual steel—$79.40 per ton; increase since 1913, 87 per cent.

Hollow tile—$220.30 per m; an increase since 1913, 165 per cent.

Broken stone—$1.85 per cu yd; increase since 1913, 106 per cent.

Roofing felt—$84.00 per ton; increase since 1913, 155 per cent.

WAGES.

Bricklayers—$1.25 per hour; increase since 1907, 78 per cent.

Painters—$1.00 per hour; increase since 1907, 100 per cent.

Electricians—$1.00 per hour; increase since 1907, 100 per cent.

Plasterers—$1.06 per hour; increase since 1907, 56 per cent.

Carpenters—$1.00 per hour; increase since 1907, 60 per cent.

Plumbers and steamfitters—$1.00 per hour; increase since 1907, 78 per cent.

Laborers—$.75 per hour; increase since 1907, 329 per cent.

Sheet metal workers—$1.00 per hour; increase since 1907, 78 per cent.

"That this increase is by no means at an end is evidenced by the increase in prices of these materials since Jan. 1, 1920. In New York the price of brick has risen from $25 to $33 per thousand; lumber from $58 to $72 per thousand feet, board measure; steel from $95 to $135 per ton; and other materials in like manner."

The great need for more homes is reflected in the lengths to which people have been driven to protect themselves from profiteering landlords, and we are told in the "Evening Bulletin", Philadelphia that:

The housing problem still exists and that Borough President Curran, of Manhattan, has asked Governor Smith to call a special session of the New York Legislature to consider the housing problem of New York City, with a specific suggestion of a constitutional amendment permitting the city of New York to enage in municipal homebuilding. Senator Lockwood who has been foremost in studying the housing problem, also asks a legislative opportunity for a general study of the situation.

The advanced code of rent laws passed by the last Legislature has not failed completely. It has provided a means of adjustment in many thousands of rent disputes, undoubtedly has prevented thousands of summary eviction, and has given greater protection to tenants. But means of evasion has been found, and, withal, it has not resulted in the construction of more homes, which is the prime need and the only true or permanent remedy for the situation.

Philadelphia watches the New York experiment with interest. Its own problem continues, practically unchanged. The summer season affords a temporary relief, but with the return from country and shore in September there is likely to be a recurrence of the experiences of last year, with perhaps an actual shortage more serious than that experienced then. Home-building is not keeping pace with the natural increase in families, and the advance in rents is going on, although the family incomes are not increasing, and commodity prices in general are recognizing the evitable necessity of deflation and are coming down.

There is likely to be an urgent appeal to the next Leislature, when it shall meet, to take effective action. Such an appeal is likely to be in the direction of so-called "rent laws" for the curbing of the profiteer landlord, and for the closer limitation of the right of eviction, as well as for the modification of the form of leases to make the supposed rights of tenants more effective.

But these are only passing forms of relief, and Pennsylvania is likely to follow the experience of New York in ultimately facing the question of securing more home-building, whether by direct action on the part of the State or the municipality, or in relief of home-building capital from some part of its tax-burden.

SOUND-PROOF ROOMS FOR BABIES IN THEATRES

The Park moving picture theatre, now being constructed at Austin, Minn., contains the last word in picture theatre construction. It is nothing less than a sound-proof, glass-enclosed room for mothers who have crying babies. In this room, which is in full view of the stage, mothers may congregate, each with her infant, and though the youngsters all cry in infantile chorus, the mothers may calmly enjoy the show, knowing that no one is distrubed and that the orchestra is not hampered in its efforts.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

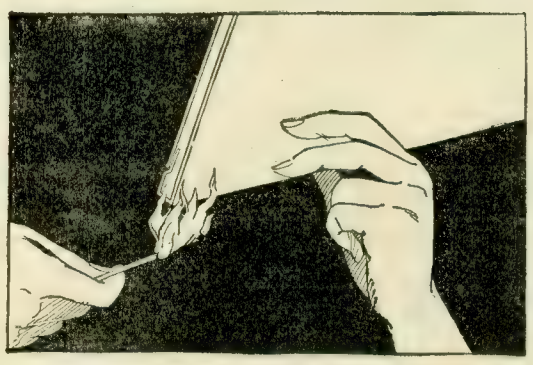
Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.



For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

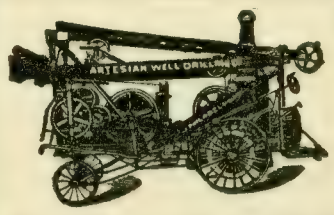
We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.



Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

CO-OPERATIVE BUYING OF APARTMENTS MEANS BUILDING

The co-operative apartments seems a possible answer to the present housing shortage and consequent high rents. There is a question as to whether the co-operative movement can reach the mass of the people by virtue of the fact that they have not enough money to make the initial outlay, but many real estate operators are sure the tenants of low-priced apartments could in proportion pay as much as those who participated in higher priced co-operative purchasing deals.

The plan of co-operative apartments is not new, but in pre-war conditions there was a tendency for such plans to fizzle out. There were several reasons for this. One of them was that the persons who entered the co-operative plan were ignorant of the management of property: another was that several members of such groups defaulted on their payments, leaving the burden of payment on the rest of the group; still another was that under the then existent low rentals it did not pay a man to become part owner in a piece of property when he could rent a flat at a price little above the expenses of ownership and escape its responsibility.

To-day, however, conditions have changed. The applicants for apartments are greatly in excess of the number of apartments to be had. The element of fear that the apartments may not be rented does not enter into the transaction. A man who becomes part owner in such scheme is more than reasonably certain that in the future, even under the best housing conditions, the cost of carrying the house plus the taxes will never be less than the rent he would have to pay were he not, in a manner, his own landlord. There is still another incentive to co-operative apartment buying. This touches most closely the man who lives in a high-price apartment. He can reduce his income tax not a little by becoming a member of a group which is meeting the cost of taxes and the payment of mortgages.

A concrete example will serve to show how the plan works out:

A group of ten men living in a house whose apartments rent for about $4,000, buy the house and land on which it stands for $575,000, let us say. There are thirty apartments in the house. The men get a mortgage on $275,000, which leaves $300,000 to be paid in cash. Each of the ten men makes an investment of $30,000. Each one gets an apartment. The others are rented at the current price of $4,000 a year. The yearly income from these twenty apartments is $80,000. The operating expenses, taxes, interest on the mortgage would, it was figured out, total an equal amount. The members of the co-operative plan would break even the first year. As the interest on the mortgage grows less and less through its amortization, the co-operators would in time be drawing a dividend on their investment. Their $30,000 initial outlay would not only assure them their apartment and their leases, but after a period of seven or eight years they would be living rent free and draw a profit on their investment besides. The original $30,000 is usually figured as advance rent for the first seven years.

If thirty persons got together in a similiar scheme, it has been figured out that an initial investment of $10,000 would insure each of them a $4,000 apartment for about $2,800. This would decrease with the amortization of the mortgage. In time, the investment of $10,000 would be made up in decrease of rent and the man would go on living in a $4,000 apartment at a yearly rental of $2,800 and less.

Woodoleum Flooring

You are safe when you buy a Woodoleum Floor.

You get an absolute and unqualified guarantee. You get a concern which is the pioneer in this line of floor coverings.

There is but one Woodoleum—accept no imitation.

Woodoleum Mfg. Co.
131 Arch Street, Philadelphia

ROCBOND

is an exterior stucco, a magnesite composition adaptable to any stucco purpose.

Rocbond is fire proof, durable, clean and free from cracks and checks.

There is a Rocbond house in your neighborhood.

Paint Protects

You save more in the long run by keeping your home painted and papered. Paint saves the surface.

WILT & DURRICK can give you a quality job at a fair price.

WILT & DURRICK
Painting and Papering
7112 GERMANTOWN AVE.
PHILADELPHIA

The first type of co-operative plan is more speculative; the second is more conservative.

In the higher priced apartment, a twelve or fifteen thousand dollar apartment under a co-operative plan can be had for a yearly rental running from five to six thousand dollars. The more expensive the apartment, it was stated, the greater the gain to the investor. He can get the current high rental on those apartments which are not tenanted by members of the plan. The aggregate of these is more than sufficient to carry the expenses of the house.

Another reason given for the growth of the co-operative plan movement apart from the rent problem is the lack of ability to get building loans. Owing to the cost of construction these days and the knowledge that this cost is due for a fall in the future, the banks are unwilling to stake prospective builders to large amounts. One man may not be able to get the necessary funds himself, but when he forms a syndicate or co-operative group, all the members of which make a cash investment, the problem of building becomes easier.

Not the smallest advantage to be gained by the floating of these co-operative schemes is the release of capital which might otherwise be lying idle. Men are not building today, because they cannot get the banks to advance them money. Neither can they get individuals to buy their property from them. Just as soon, however, as a real estate man disposes of his house by selling it to a group of tenants who pay a large sum in cash he can turn that money into putting up a new house. The function of the man who owns property, it was pointed out, is to build. Any money that he has will naturally be turned into building channels.—*American Contractor.*

RESOLUTIONS OF MASTER BUILDER'S EXCHANGE OF PHILADELPHIA

The following resolutions were adopted at the special meeting of the Master Builder's Exchange, Philadelphia, on Tuesday, July 20, 1920, viz:

WHEREAS, During the years 1918 and 1919 the Master Builder's Exchange, through its Advisory Board, endeavored by consutation and agreement to pacify the demands of the Allied Building Trades of Philadelphia, with but a small measure of success, and,

WHEREAS, The year 1920 having witnessed increased wages in practically every branch of the Building Industry. we note with alarm further unjust and arrogant demands of the Council of Allied Building Trades, not contemplated in the fixed agreements with their employers, and threats on the part of said Council to enforce by sympathetic strike such unjust and arrogant demands upon the already overburdened Industry; and,

WHEREAS, We, the Board of Directors of the Master Builder's Exchange, an Institution formulated for the encouragement and protection of the Building Industry, and which has been the leader of the Organizations of Philadelphia for the common good for many years past, view with concern the gradual decline in the activity of the Building Industry, due primarily to the condition of uncertain prices and time of completion of work, and also due to losses caused by strikes and general inefficiency of the employee; and,

WHEREAS, We, this Board, as Business Men, feeling a responsibility because of our position, and being vitally interested in the continuance of our Industry without the inevitable temporary cessation that a continuance of these conditions will bring about, with the resultant hardships not only to our members and the Building Industry in general, but the employees as well,

Do hereby resolve, and recommend to the Corporation for adoption:

First.—That we endorse the declaration of principles of the Industrial Committee of the Chamber of Commerce, of Philadelphia.

Second.—That, in order to encourage a greater activity in our Industry, we singly and collectively use our best efforts personally with those from whom we purchase materials for the construction of buildings, to decrease the present margin of profit of material to the lowest possible figure.

Third.—That a Committee, consisting of two representatives, be appointed by each Trade or Trade Association and Profession connected with the Building Industry, to be known as the Master Builders' Exchange Committee on Trade Relations and Policy, whose duty it shall be to work in conjunction with the Industrial Relations Committee of the Chamber of Commerce on the broad policy outlined by it; and with any other committees of other organizations of like character, to formulate plans, ways and means for the future resumption of our Industry.

Fourth.—That wide publicity be given to these resolutions and notification be sent to the Industrial Relations Committee of the Chamber of Commerce, and all such other committees of a like character, of these actions, and all members of Master Builders' Exchange be notified and requested to co-operate and support this resolution in its entirety.

PEP PARAGRAPHS

Success is applied common sense.

The man with a plan is the man who can.

A smile is your best reference and introduction.

If you know what you know, you're sure of the dough.

An ounce of salve is worth more than a ton of bitters.

Kindness will win any dog, whether he has four legs or two.

It's a lot better to drive yourself than to be driven by another.

Four bits are four bits, but there's no known value of an I. O. U.

Some folks think a thing's such a cinch that they won't even try.

If you want to convince the other fellow, start in convincing yourself.

Give a man all that's coming to him, whether it's a kindly word or a rip up the back.

Some guys have a way of looking wise and prosperous, and manage to get away with it; but it takes real brains and work to look and act that way, that's why they are wise and prosperous.

(Copyright, 1920, by S. A. Chandler.)

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

As The Editor Sees It

IT seems very fitting at this time to consider the "open shop" and to present some of the views advanced concerning this most discussed topic. We are prone to believe that if the unions had not made the "closed shop" so insufferable the question would never have been brought to such a decided issue.

As an illustration, we quote an instance cited by the Manufacturers' News, of a *Union* Street car conductor, Bernard O'Reilly, employed by the Chicago Surface Lines.

He was a young fellow who believed in the gospel of work. He had a wife and a bright little child, Mary, two years old, and his home life was all that honest mutual love and devotion could make it. Bernard, impelled by the home-making instinct, wanted a nest for his own, and so he bought a little home on the installment plan.

His regular working hours left him with some spare time on certain days of the week, and this time he employed by working on a building at 4017 Irving Park boulevard.

Every dollar earned was reducing the mortgage on his wife's and baby's home. He sang at his work. Life had never seen so pleasant.

Then, on February 9, along came one Thomas Jakubowski, swarthy and ugly of mein, overbearing and stolid, business agent for the Hodcarriers' Union. He demanded to see O'Reilly's union card and when the latter could not produce one ordered him to quit work. O'Reilly urged that he was a member of the street car men's union and therefore should be allowed to continue at his labors.

Jakubowski insisted upon his demand and after having exhausted his vocabulary had recourse to the walking delegate's most persuasive argument, the revolver. He deliberately shot down the man who had the temerity to dispute his authority.

Does it seem possible that such a condition will be allowed to exist in this land of freedom.

Presenting labor's view of the question, James S. Meade, says, in the Philadelphia "Public Ledger."

There has been much adverse criticism in the public press of this city within the last few weeks relative to organized labor, and it seems that the newspapers of the city apparently do not think it worth while to interview the representatives of organized labor to get their views as regards the local labor situation, particularly as it applies to the building-trade industry. The writer cannot rest quietly under the said criticism, as facts have been repeatedly controverted in this respect.

The so-called "open shop" is a misnomer, as it really means a closed shop against organized labor. Employers who desire to make generally effective this plan do so solely through selfish and mercenary motives; and while they have their own associations for collective action regarding labor, yet they seek to deny the same privilege to their employes.

This last statement seems to have no foundation on fact, for accordindly to G. W. Neippiert, who has made an exhaustive study of the situation.

Open shop associations have within the past year been established in nearly one hundred communities in which the employment situation had been brought to a critical point by the exactions and arbitrary demands of labor unions, and in this term may be included the American Federation of Labor as well as the Industrial Workers of the World and similiar radical organizations, all of which insisted by fair means and foul upon the establishment of what they call the "closed shop." In a closed shop none but union members can be employed and independent workingmen are prohibited from doing any kind of work, even the most menial, in and around the premises of a plant, hotel, store or other business controlled by organized labor.

The slightest infraction of this rule has been the cause of innumerable strikes and boycotts and has entailed an enormous pecuniary and production loss upon the country as a whole.

DRAWING MATERIALS

CHARLES H. ROBBINS, JR.

BLUE PRINTS

NOT satisfied with controlling the personnel of business, the American Federation of Labor and similiar bodies have undertaken to dictate its policy, working hours and working conditions in such a manner as to interfere seriously with the productive capacity and the working efficiency of every establishment controlled by them through their business agents. The open shop movement is denounced by union leaders as having been called into existence for the one and only purpose of exterminating the unions. *Nothing could be farther from the truth.* The open shop associations already established and those in the process of organization are based primarily on co-operation, just treatment, mutual understanding and good will between employers and employes, so that work of all kinds may be carried on with a maximun of speed, economy and efficiency. Secondarily, their aim is to promote and safeguard the interests of all citizens, including both employes and their families, by insuring through the establishment of the open shop equal opporunity for all and special privileges for none and preventing unjust discrimination between employers, employes and the general public.

*The righs of labor to orzanize is recog*nized, as far as I could learn, by every open shop association on the theory that justly conducted labor unions have accommplished much for laboring men. A thorough investigation of the subject has led to the conclusion that it is in no sense the intention of these associations to combat or undermine union labor, but rather to protect personal property and property rights by assuring non-union workers an equal chance with union workmen.

Thus, it is seen the open shop advocates have no quarrels with unions, except as they try to interfere with the American principles of liberty, justice and equality. Thus we will agree with George Mueller, another "closed shop" advocate who contends, in the "Public Ledger" that much good has been accomplished for labor through unions. There is no doubt that organization is a necessary thing in these days; men must band together and elect a spokesman or leader —it is so in every phase of our social existence from religion to politics; but we do no believe that any one class should forget its obligations and relations to the other classes of society and live to and for itself alone.

Just how far unions have gone is shown by a statement in the Builders' Journal.

"The intolerable conditions," says "The Journal" that exist in the ranks of building labor are steadily raising the cost of building to a point where a complete shut down of construction work will be the only remedy. The rate of wage is not by any means the worst feature; this would be willingly paid both by builders and the public if there were a normal amount of work produced in return for it, but aggravated as it is by the very evident intention of the unions to restrict production an impossible situation is created which will in the end work to their own disadvantage.

Typical of the high handed methods of the unions and their inability to see where their policies are leading them is the action of the Building Trades Council of St. Louis, Mo. The unions of that city have issued a notice to all architects, engineers, contractors and master builders, that following September 1, 1920, they shall be required to submit to the Council the names of all contractors and sub-contracors bidding on buildings and the installation of equipment. No building work they say will be undertaken until such a list is furnished and neither will any work be done if any of the firms listed as bidding employ any workmen not union members.

This is straight from the shoulder talk and it gives a clear idea of where the unions stand. It creates an issue that must be met by all employing contractors for otherwise they might as well turn their businesses over to the unions. The concensus of opinion among the contractors of St. Louis is that all building will be shut down on September 1st and not reopened until the ruling is repealed. The closed shop is opposed to American principles; it gives opportunity for the creation of abuses that will stifle all business and from information reaching us from various cities, builders realize that different conditions must be brought about and they are making a determined stand for the open shop.

To substantiate the claims that "open shops" does not mean lower wages; that it does not mean discrimination against union labor; that it does mean a square deal for all, we print a report from the Associated Industries of Seattle, which tell of the success of the Open Shop movement in that city.

Seattle today is practically a strikeless city.

Several months ago the story of how the Associated Industries of Seattle had broken the domination of radicals over the industries of that city, by a firm and successful stand for open shop, was published broadcast throughout the United States. The employers of Seattle, banded together in the Associated Industries, declared their independence of restrictive union rule; stood for their rights to hire their own men and the right of the employees to work, regardless of membership or lack of membership in a union; and established those rights by defeating a series of strikes to enforce unreasonable demands.

Back of this stand of the united employers of Seattle was the knowledge that the radical labor leaders had planned to practically take over the industries of Seattle and operate them, ostensibly in the interest of organized labor. Accordingly it was a fight for the perpetuation of industrial freedom in Seattle in which the whole United States was interested.

The story of the method followed by the Associated Industries in defeating strikes and establishing the open shop; of the broadsides and other publicity in the daily newspapers to win public sentiment over to the "American Plan" of industry; of other phases of the struggle in which employers stood steadfast with unbroken ranks in the face of efforts to close their plants, was read with sympathetic interest by employers throughout the United States, and the Seattle plan of open shop campaign has been adopted in several notable instances since that time.

Naturally, the question has arisen in many minds: Will the Seattle plan endure? Will results be permanent and justify the struggle and expense entailed in putting it over?

Events of the past six months in Seattle justify answering this question in the affirmative. While many sections of this country are still troubled with destructive strikes and interference with production, Seattle today is free from strikes, harmony between employes and employers is on the increase, and the open

20 Year Barrett Specification Bonded Roof on Marion County Court House, Salem, Ill.

Architect: W. J. Royer, Urbana, Ill. Gen'l. Cont.: Cope & McDonald. Roofer: E. E. Hayes & Son, Centralia, Ill.

Barrett Specification Roofs

Bonded for 20 and 10 Years

One "experiment" was enough—

WHEN the Marion County Court House at Salem, Ill., was built a few years ago, it was not at that time covered with a Barrett Specification Roof. Instead a more expensive type of roof was chosen.

After only four years of service an entirely new roof was required. Needless to say, one experiment was enough. This handsome structure now carries a Barrett Specification Roof, guaranteed to be free from all maintenance and repair expense for 20 years.

Surety Bond Roof Insurance

The Barrett 20- or 10-Year Guaranty is in the form of a Surety Bond, issued by the United States Fidelity and Guaranty Company of Baltimore.

Any Barrett Specification Roof of 50 squares or larger, in towns of 25,000 and over—and in smaller places where our Inspection Service is available—may be thus insured free of charge.

All the owner need do is insert the following paragraph in his building specifications:

"This roof shall be constructed in accordance with the Barrett Specification *revised April 15, 1920,* and the roofing contractor shall obtain for me the (20- or 10-year) Guaranty Bond therein mentioned."

Our only stipulations are that the Barrett Specification *revised April 15, 1920,* shall be strictly followed and that the roofing contractor shall be approved by us and his work subject to our inspection.

Important Notice

The Barrett Specification Type "AA" 20-Year Bonded Roof represents the most permanent roof-covering it is possible to construct, and while we bond it for twenty years only, we can name many roofs of this type that have been in service over forty years and are still in good condition.

For those who wish a somewhat lighter and lower priced roof covering, we recommend the Barrett Specification Type "A" Roof bonded for 10 years.

Both roofs are built of the same high-grade waterproofing materials, the only difference being the quantity used.

Full details regarding these Bonded Roofs and copies of The Barrett Specifications sent free on request.

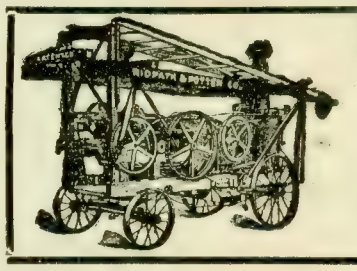
Rubin, 1127 Thompson street, Philadelphia.

Store (alts.), 35 South Thirteenth street,



Painting Prices

We see no indication of painting prices coming down for some time. But to delay painting and invite expensive repairs to cover depreciation is bound to be more expensive than any difference in painting costs could be.

Business is founded on reciprocity and co-operation. Any other plan than this spells bankruptcy. The successful business nowadays has a heart and a soul.

Fireproof Walls that Endure

In building a new home or in remodeling your present one, you will be certain of walls and ceilings that cannot burn and that will endure as long as the structure lasts if you specify Sheetrock.

For this standard wall and ceiling material in unit form, manufactured by the special U. S. G. process and sheathed in a heavy protective covering, is a sheet of pure gypsum rock.

It is fireproof. It cannot warp, shrink or buckle. It resists heat, cold and sound. It takes any decorative treatment: paper, paint, panels.

Sheetrock is easily put up. It can be cut and sawed like lumber. It can be securely nailed directly to the studs and joists, and it is reinforced with the U. S. G. Patented Reinforcement which gives extra nailing strength and a tight, flush joint.

Let us show you a sample of Sheetrock. Let us prove by actual demonstration that it insures economy and enduring satisfaction in new construction as well as for alterations and repairs.

We Can Save You Money on Insurance Premiums

By Assisting You in the Planning and Construction of Buildings

The construction and arrangement of buildings in proper sections, the placing of manufacturing equipment and of stock, the proper location of fire doors, and various other details insisted upon by the Underwriters' Association, can be planned before the building is erected. Thus you can be saved a considerable amount of money in reduced premiums.

Beidler & Bookmyer maintain a department of trained men for the sole purpose of assisting you in planning and erecting structures on which you can get a lower fire insurance rate.

This is Beidler & Bookmyer Service. It is our conception of service, and service to us means that your interests stand paramount.

(Continued from Page 696.)

shop has been established in every industry in which a strike had occurred.

When the story of Seattle's struggle to throw off the radical yoke was published, strikes in the building trades, the cleaning and dyeing and some other minor industries, had been won, and the communities throughly converted to the open shop idea, but several other strikes were still in progress, leaving the ultimate outcome in doubt. Since that time the employers have won out against the printers, one of the oldest and most powerful unions in Seattle; against the tailors and several other unions which saw fit to strike. Since August, 1919, every strike has been completely won by employer and the open shop substituted for radical union domination.

Following a winter of comparative peace, radical union leadership attempted to force the issue again in the spring, in the hope of breaking the open shop movement. Attempts to force a new agreement with burdensome conditions on the baking industry late in April resulted in an open shop declaration by the master bakers, and a new strike which the employers won in short order. An obortive attempt was made to call out the workers in the building trades on May 1, which amounted to nothing, for the building trades workers had their fill of strikes last year. The defeat of the building trades strike, which lasted from August to November, 1919, was the first important victory of the Associated Industries and the occasion of the first open shop declaration. Since that victory, things have progressed in the building trades, accompanied by increased production. The majority of the union workers had accepted open shop conditions. They did not wish to go through another period of enforced idleness and so the efforts of union leaders to bring on another strike and overthrow the open shop was fruitless.

The most striking example of Seattle's freedom from the old time radical domination, however, occurred on the Seattle water front. During the war, the local of the International Longshoremen's Associaion got a strangle hold on water front employment. Employers had practically nothing to say about the hiring of men, gangs of longshoremen and truckers being furnished by the union from the union list at the union hall. Although Seatle is a busy port, the union contained about twice as many men as there were full employment for. As a result, the work was often stretched out sufficiently to give a satisfactory measure of employment to all and the cost of handling cargo became inordinately high. Last fall, the employers succeeded in reaching a new agreement which abolished the list system, but early in May the I. L. A. served peremptory notice on employers of the re-establishment of the list system, thereby breaking the clause of thier agreement requiring thirty days notice of termination.

There is a large radical element in the Seattle local of the I. L. A. In fact, it was regarded as one of the last strongholds of radicalism, and a test of strength had been postponed as long as practicable by the employers, but the course of the union left no alternative but to declare open shop and fight it out. That action was taken by the employers. A surprising number of men responded to advertisement of work under the open shop. Within two weeks, work reached normal on the Seattle water front, and the I. L.A. declared the strike off under orders from the international officers who had refused to sanction the strike. As a result, there is a surplus of 1000 to 1500 men on the water front who will eventually have to find other work, for the employers are giving practically continuous employment to those who helped them out during the strike, and who wish to remain at work. Also the conservative element of the union has broken away from the radical leadership and is applying for a charter for a new local.

Also, Seattle escaped any interruption of freight service. While railway workers were striking in many sections of the country, the railway workers and switchmen refused to go out, even in sympathy with the longshoremen.

The Associated Industries has just held its second annual election. In one year of work it has changed Seattle from a radical-ridden and strike distrubed city to one of the most peaceful and productive cities, from the commerical and industrial standpoint, in the United States. The defeat of the radicals has driven some thousands of them from the city, and Seattle is no longer the strong-

"Save the Surface"

hold of the I. W. W. and the hotbed of soviet conspiracy.

Yes, the Seattle plan has proved a success. The Associated Industries, after an eventful year, is stronger in membership, finance and influence than ever before. It has followed consistently the declaration of a square deal for the employes. In spite of the surplus of labor that has existed for several months with its decadence of the shipyards its members have lived up to their pledge that wages would not be reduced until living costs receded. In some instances wages have been increasd without any requests being made by the employes.

Seattle union men are not discriminated against in the operation of the open shop. Instead, the employers simply refuse to deal with the unions as such. The shop committee system is being worked out to give employes the representation promised them under the open shop. The policy of the Associated Industries is to give the employes such representation and fair treatment that the union is unnecessary to them.

That is why Seattle today is a strikeless city.

LUMBER VS. GENERAL BUILDING

More lumber is used in the United States for general building and construction than for any other purpose, says the U. S. Forest Service report of June 1, 1920, before the Senate. In normal years probably 28 billion board feet is used in this way, out of an average annual cut of 40 billion feet.

For the first five years before the war, 1910-14, the average annual building bill of the country shown by the building permits was approximately $670,000,000. After dropping to $445,549,493 in 1918, it rose in 1919 to $1,326,936,702; but with building costs increased 100 per cent. or more, actual construction did not much, if any, exceed the pre-war average. Apparently, construction work throughout the United States is behind requirements. The deficit is greatest in dwelling houses.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building magazine this side of Manhattan Island.

A CONSTITUTION OF INDUSTRIAL RELATIONS

Committee on Labor Submits Statement of Fundamental Principals of Industrial Employment.—Relations Adapted from Report of Chamber of Commerce of the United States—Prelude to Framing of Specific Provisions Covering Particular Needs of the Construction Industry—Open Shop, Collective Bargaining, Obligation to Produce, Community of Interest, Right of Public Service over Private Interests Emphasized—Criticisms of Members and Others Invited Before Report is Finally Adopted

Introduction

THE strict application of the injunction, "thou shalt love thy neighbor as thyself," would solve most of the ills incident to human relations. No further statement of the principle would be necessary.

But as men are constituted, while a considerable proportion of them would admit the righteousness of the injunction, few could lay claim to using it as an unvarying guide in daily practice. This, after all, is merely another way of stating that humanity is still very far from achieving perfection.

Hence, it is encouraging to find that, in frank recognition of their ethical limitations, various groups of men are reaching out in the endeavor to discover and to establish principles that, while constituting an approach to an ideal not yet fully attainable, will meet the conditions of an imperfect present.

Evidence of this is most clearly observable in the struggle to interpret and to establish relations between employers and employes. Here is needed a declaration of principles so basic, so wide in scope, so fair in application, so clear in expression, that it may be accepted as a constant measure of the justice and wisdom of the temporary devices that must be framed to meet the fluctuating conditions.

Such a declaration the undersigned Committee has widely, but unsuccessfully, sought. The closet approach to it they have found in the *Statement of Principles* enunciated by the Chamber of Commerce of the United States, (February 2, 1920) and included in Referedum No. 31 on the report of the committee on Industrial Relations regarding employment relations (June 9, 1920).

A multidue of tongues saying the same thing in different ways, produce nearly as much confusion as if they were saying different things. In this belief, the Committee has felt that the ends of clarity and uniformity would best be met by adopting the form and phraseology of the United States Chamber of Commerce Statement, modified by the omission of details, but retaining the fundamental principles that underlie all employment relations.

That statement, therefore, with such changes as will serve to increase its applicability, is offered in the following pages.

It is the Constitution of Industrial Relations. It is the standard of measure for the special rules, or Statutes, that must be framed for the specific industry concerned.

Fundamental Principles of Industrial Employment Relations

Premable

Employment relations should accord with and express ideals of justice, equality and individual liberty, The terms of employment should conform to the essential requirements of economic law and should, through intelligent co-operation, based on a recognition of mutuality of interest, conduce to high productive efficiency. They should reflect an effort to realize ideals of individual and social betterment.

The interest of the public, which includes every individual in the community, is paramount. It is composed of interdependent interests whose just balance necessitates that impartial justice be accorded to every individual.

There is a mutuality of interest among employers, employes, and investors. Their interest as well as the public interest must be defined and protected and to this end public opinion must be kept informed and enlightened.

The first step toward industrial peace will be a realization of the interdependence of all elements related to industry and a recognition of their responsibility one to another.

In government and public service employment the orderly administration of government must be assured, and the paramount interest of the public protected.

Briefly stated, Justice to all interests, Co-operation between employer and employee, produces Service to the public.

Principles

1—The Employment Relation

Every person possesses the right to engage in any lawful business or occupa-

---

Portland Cement, Sand or Gravel by carload. Consult DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

tion and to enter, individually or collectively, into any lawful contract of employment either as employer or as employee.

II—The Open Shop

The right of employer and employee to enter into or to determine the conditions of employment relations with each other (without reference to the affiliation or non-affiliation of either with any organization) is an individual right of free contract possessed by each of the parties.

III—Right of Association

All men possess the equal right to associate voluntarily for the accomplishment of lawful purposes by lawful means. The association of men whether of employers, employes, or others, for collective action or dealing, confers no authority over and must not deny any right of those who do not desire to act or deal with them.

IV—Responsibility of Combinations

The public welfare, the protection of the individual, and sound employment relations equally require all associations or combinations be subject to the authority of the State. As the public interest is paramount, full publicity of facts of industrial relations is necessary.

V—Obligation to Secure Production

To develope, with due regard for the health, safety aind well-being of the individual, the maximum capacity and output required of industry is the common social obligation of all engaged therein.

VI—Wages and Management

The wage of labor must be drawn from the product of industry and must therefore be earned and measured by its contribution to production. All employees are entitled to complete business information in matters affecting the terms of their employment; and frankness is essential. In order that the worker, in his own and general interest, may develope his full productive capacity, it is the duty of management to assist him secure regular employment suited to his abilities, to furnish him with incentive and opportunity for self improvement, and to provide proper safeguards for his health and safety.

VII—Hours of Labor

The number of hours in the work day or week in which required maximum output, consistent with the well-being of the workers, can be maintained in a given industry should be ascertained by careful study and never should be exceeded except in case of emergency. One day of rest in seven, or its equivalent, should be provided.

VIII—Adjustment of Employment Relations

Adequate means satisfactory both to the employer and to his employes, and voluntarily agreed to by them, should be provided for mutual discussion and adjustment of employment relations.

IX—Community of Interest

The greatest measure of reward and well-being for both employer and employe, and the full social value of their service to the public must be sought in the successful conduct and full development of the industrial establishment in which they are associated. Intelligent and practical co-operation based upon a mutual recognition of this community of interest constitutes the true basis of sound industrial relations.

X—Government Employment

The State is sovereign and cannot tolerate a divided allegiance on the part of its officers and servants. While the right of government employes, national, state or municipal, to be heard and to secure consideration and just treatment should be amply safeguarded, the community welfare demands that no combination shall be permitted to prevent or impair the operation of government or of any governmental function.

XI—Public Service Employment

In public service activities the public interest and well-being must be the paramount and controlling consideration. The power of regulation and protection exercised by the State over the corporation should properly extend to the employes in so far as may be necessary to assure the adequate, continuous, and unimpaired operation of public utility service.

The Committee on Labor of the Associated General Contractors desire the greatest possible publicity and discussion of the foregoing statement. It invites constructive criticism in order to perfect this draft, if necessary.

It is hoped that it may ultimately be widely adopted as the guide for all industrial employment relations.

LABOR EFFICIENCY AND INEFFICIENCY

The year 1920 is so far showing a slight increase in efficiency of labor over the latter part of 1919, although production at present is not up to the pre-war standard, according to a summary of replies from a list of 169 representative manufacturers to a recent questionnaire sent out by the National Association of Credit Men, and quoted in the June *Monthly Labor Review.*

Comparing the efficiency in March, 1920, over December, 1919, one-third of the number of firms reported an increase in efficiency; nearly one-half reported no improvement, and six per cent. reported a decrease in efficiency over December, 1919.

About 10 per cent. stated that labor was as efficient as in pre-war times, and six per cent. stated that old labor showed as much efficiency as in the pre-war period, but that new labor was inefficient. About 70 per cent. of the 169 companies report labor as being less efficient now than in 1913-14. Although 16 per cent. state that their labor is as efficient now as formerly, only three per cent. declare that it has reached a standard of efficiency higher than in "normal" times.

A large number of employers attribute lowered production to labor shortage. Other important causes cited are industrial unrest, high rate of labor turnover, high wages, reaction from the war, and high cost of living.

Among the causes assigned for increased efficiency are profit-sharing, bonuses, high wages, industrial welfare work, improved methods of management, abatement of industrial unrest, and the education of employees along economic lines.

JUNE BUILDING FIGURES

Returns from the building departments of Atlanta, Boston, Chicago, Cleveland, Detroit, Kansas City, Los Angeles, Milwaukee, Newark, Borough of Bronx, Philadelphia, and Portland, Oregon, all show gains in estimated value of June permits awarded over May permits, says the *American Contractor* in its July 10th issue. These figures give color to the idea that many projects are to be kept to the point of preparation for an early start

If you want Trap Rock or Slag, any size or grit, we are headquarters for same. DAVID FRANCE CO., Tasker Street Wharf, Delaware River, Philadelphia.

when the break in building stagnation comes.

On the other hand, these cities show a loss in June over May: Akron, Baltimore, Indianapolis, Minneapolis, Omaha, Pittsburgh, St. Louis, San Francisco, Tulsa, Tacoma, Washington and New Orleans.

The *American Contractor* gives the following table, showing the estimated valuation in millions of dollars in the cities indicated for the high and low month of 1920 and for the month of June. The figures are correct to tenths and give a ready comparison of activity thus far in 1920.

Estimated Valuation of Building Permits in Millons of Dollars showng High Month, Low Month and Month of June, 1920.

Chicago—High March, 10.6, low, May 5.7; June, 6.8.

Boston—High, March, 4.8; low, February, 1.0; June, 2.6.

Baltimore—High, April, 7.9; low, June, 1.2; June, 1.2.

Cleveland—High, April, 12.2; low, February, 3.6; June 5.8.

Detroit—High, April 12.4; low, January, 5.7; June, 8.4.

Los Angeles—High, June 6.6; low, March 3.1; June, 6.6.

Minneapolis—High, April 2.3; low, June 1.2; June, 1.2.

Milwaukee—High, April 3.3; low, January, 1.0; June, 3.1.

Philadelphia—High, April 9.9; low, January 3.5; June, 6.7.

St. Louis—High, May 2.1; low, January, 1.2; June, 1.9.

New Orleans—High, May 2.2; low, February 0.3; June, 1.2.

It will be seen from this table that April was the peak month of the first half of the year and that in only one city, Los Angeles, was June the high month. The months seasonally unfavorable to building, January and February, are naturally those which are named oftenest as low months in the table; but in Baltimore and Minneapolis, June was below even these winter months in valuation of building permits. Car shortage is a predominant causes for the present building inactivity.

LOWER BUILDING COSTS IMPROBABLE

Construction Has Not Kept Pace With Requirements

There is a singular unanimity of opinion among those identifled with the construction business that there is little likelihood of a reduction in building costs for some time to come.

P. F. Ayer, chief planner of the Aberhaw Construction Co., says:

"What force can be exerted that will produce a decline in the cost of building? The steel, cement, brick and lumber for the buildings of tomorrow are today in mine, clay bank and forest, entirely untroubled by considerations of passing whims of style. If they are not wanted, they will stay where they are quite untroubled.

"But they will be wanted. Statistics covering a period of years make evident that industry in America requires an annually added increment of building space proportioned to the nation's increase in population. Of late, however, the increase of construction has not kept pace with requirements. At the present time, the deficit is approximately one and one-half billion dollars worth of construction. This represents considerably more than six months' work.

"There was a heavy production of shoes and clothing ready for a market that never fully materialized. In the case of construction, there is an actual shortage that becomes each day increasingly manifest. Evident shortages never yet encouraged reduced prices.

"And not only this: It is a fair assumption that those things whose costs rose the most rapidly will experience the most rapid decline, and that those last to reach the peak of prices will be the last to leave it. In that case, building costs will be a long time in exhibiting any material recession, for only within the past few months have they approached the percentage of increase which general commodities have shown.

"For example; taking 1914 as standard, in 1916 commodity prices had risen 20%; building prices but 17%. By the end of 1917 general commodities had advanced 89%; building but 39%. Building costs through 1919 were 90% above the 1914 level, whereas general commodities were up 138%.

"Latest Aberthaw computations of building costs place them at 135% above the 1914 level; commodity prices are 142% above their earlier level.

"In all of the widespread discussions of building costs there seems pretty general agreement that reduction can take place only through the operation of one, or all, of three courses:

"First; a reduction in demand. Such a reduction may temporarily take place; indeed, it is a phenomenon of the present moment. That it will endure in the face of a very genuine shortage is beyond belief.

"Second; a reduction in wages. With a labor shortage estimated at close to four million workers, the likelihood of an early occurence of what has been termed a liquidation of labor' seems extremely doubtful.

Third; a reduction in the price of materials. In a few lines there have recently been slight price concessions. But with the existing famine in construction very little concession will stimulate a purchasing enhusiasm that will very speedily eliminate the concession. Add to this fact that of a rapidly approaching increase in freight rates and the likelihood of decreasing prices of materials begins to appear remote.

"There is just one measure that may be looked to for reducing the cost of building as well as the cost of anything else: That is a greater efficiency in production —more accomplishment per man per hour. In construction work this can hardly mean greater speeding up of individuals except as more and more mechanical plant may be utilized to minimize hand labor. In general, however it will mean increasing skill on the part of management in so planning and conducting the work of the men on a job that waste time and waste motion are eliminated."

HOME BUILDING EXPERIMENT IN ENGLAND

One of the features in a home building experiment in Manchester, England, as given in the last *Monthly Labor Review*, is the provision made for full week or all-weather employment by having one staff for inside and outside work. In fine weather all the workers are concentrated on outside jobs and in wet weather they are shifted to the inside. This method will result in having many houses at different stages of completion at one time and calls for a corresponding large working capital, but Manchester stands ready to meet this difficulty.

The municipality is to provide the funds for erecting 1000 houses in one of its surburbs while the building guild is to furnish not only the manual labor, but also the technical and administrative workers. The city is to pay the labor cost and 10 per cent. additional, and is to receive the houses when they are built. The extra 10 per cent. is to cover losses, transportation cost, etc., and the city council is to buy the building material..

Washed Bar Sand and Gravel will take less cement on concrete work. We know how.
